Description

BIOINFORMATICALLY DETECTABLE GROUP OF NOVEL REGULATORY GENES AND USES THEREOF

BACKGROUND OF INVENTION

CONTINUATION STATEMENT

[0001] This application is a continuation in part of U.S Provisional Patent Application Serial No. 60468251, filed 07-May-03, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof ", and is a continuation of U.S Patent Application Serial No.10604985, filed 29-Aug-03, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof",and is a continuation in part of U.S Provisional Patent Application Serial No. 10345201, filed 16-Jan-03, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof",and is a continuation in part of U.S Patent Application Serial No10293338, filed 14-Nov-02, entitled

"Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof ", and is a continuation in part of U.S Patent Application Serial No. 10310914, filed 06-Dec-02, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof ", and is a continuation in part of U.S Patent Application Serial No. 10321503, filed 18-Dec-02, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof ", and is a continuation in part of U.S Patent Application filed 29-Aug-03, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses of Thereof", and is a continuation in part of U.S Patent Application Serial No. 10604926 , filed 27-Aug-03, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof ", and is a continuation in part of U.S Patent Application , filed 28-Aug-03, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof ", and is a continuation in part of U.S Patent Application Serial No.10604726, filed 13-Aug-03, entitled "Bioinformatically Detectable Group of Novel Regulatory Genes and Uses Thereof", and is a continuation in part of U.S Patent Application Serial No.10604727, filed 13-Aug-03, entitled "Bioinformatically Detectable Group

of Novel Regulatory Genes and Uses Thereof", the disclosures of which applications are all hereby incorporated by reference and claims priority therefrom.

BRIEF DESCRIPTION OF SEQUENCE LISTING, LARGE TABLES AND COMPUTER PROGRAM LISTING

[0002] Sequence listing attached to the present invention. The Sequence listing comprising 20,189 genomic sequences, and is contained in a file named SEQ_LIST.EXE (2991KB).

[0003] Large tables relating to genomic sequences are stored in 5 text files, each comprising a respective one of the following table files: TABLE1.TXT (18KB); TABLE2.TXT (102KB); TABLE3.TXT (16KB); TABLE4.TXT (13855KB) and TABLE5.TXT (9467KB).

[0004] Computer program listing of a computer program constructed and operative in accordance with a preferred embodiment of the present invention is enclosed on an electronic medium in computer readable form, and is hereby incorporated by reference. The computer program listing is contained in 7 text files, the name and sizes of which are as follows: AUXILARY_FILES.TXT (117K); BINDING_SITE_SCORING.TXT (17K); EDIT_DISTANCE.TXT (144K); FIRST-K.TXT (96K); HAIRPIN_PREDICTIO.TXT (47K); TWO_PHASED_PREDICTOR.TXT (74K);and TWO-

PHASED-SIDE-SELECTOR.TXT (4K).

FIELD OF THE INVENTION

[0005] The present invention relates to a group of bioinformatically detectable novel genes, here identified as Genomic Address Messenger or GAM genes, which are believed to be related to the micro RNA (miRNA) group of genes.

DESCRIPTION OF PRIOR ART

[0006] MIR genes are regulatory genes encoding MicroRNA"s (miRNA), short ~22nt non-coding RNA"s, found in a wide range of species, believed to function as specific gene translation repressors, sometimes involved in cell-differentiation. Some 110 human MIR genes have been detected by laboratory means. Over the past 6 months, the need for computerized detection of MIR genes has been recognized, and several informatic detection engines have been reported (Lim, 2003; Grad, 2003; Lai, 2003). Collectively these informatic detection engines found 38 more human MIR genes which were later confirmed in zebrafish, 14 human MIR genes which were confirmed in human, and 55 postulated human MIR genes which could not be confirmed by laboratory (Lim, 2003). Extensive efforts to identify novel MIR genes using conventional bio-

logical detection techniques such as massive cloning and sequencing efforts, and several bioinformatic detection attempts, have led leading researchers in the field to the conclusion that the total number of human MIR genes is between 200 to 255 (Lau, 2003; Lim 2003 Science; Lim, 2003 Genes Dev). Recent studies postulate that the number of MIR genes may be higher (Grad, 2003; Krichevsky, 2003).

[0007] The ability to detect novel MIR genes is limited by the methodologies used to detect such genes. All MIR genes identified so far either present a visibly discernable whole body phenotype, as do Lin-4 and Let-7 (Wightman ,1993; Reinhart , 2000), or produce sufficient quantities of RNA so as to be detected by the standard molecular biological techniques.

[0008] Initial studies reporting MIR genes (Bartel, 2001; Tuschl, 2001) discovered 93 MIR genes in several species, by sequencing a limited number of clones (300 by Bartel and 100 by Tuschl) of small segments (i.e. size fractionated) RNA. MiRNA encoded by MIR genes detected in these studies therefore, represent the more prevalent among the miRNA gene family, and can not be much rarer than 1% of all small ~20nt-long RNA segments.

[0009] Current methodology has therefore been unable to detect micro RNA genes (MIR genes) which either do not present a visually discernable whole body phenotype, or are rare (e.g. rarer than 0.1% of all size fractionated ~20nt-long RNA segments expressed in the tissues examined), and therefore do not produce significant enough quantities of RNA so as to be detected by standard biological techniques.

SUMMARY OF INVENTION

[0010] The present invention relates to a novel group of regulatory, non-protein coding genes, which are functional in specifically inhibiting translation of target proteins. Each gene in this novel group of genes, here identified as GAM or Genomic Address Messengers, specifically inhibits translation of one of more other `target` genes by means of complementary hybridization of a segment of the RNA transcript encoded by GAM, to an inhibitor site located in an untranslated region (UTR) of the mRNA of the one or more `target` genes.

[0011] In various preferred embodiments, the present invention seeks to provide improved method and system for specific modulation of expression of specific known `target` genes involved in significant human diseases, and im-

proved method and system for detection of expression of novel genes of the present invention, which modulate these target genes.

[0012] Accordingly, the invention provides several substantially pure DNAs (e.g., genomic DNA, cDNA or synthetic DNA) each encoding a novel gene of the GAM group of gene, vectors comprising the DNAs, probes comprising the DNAs, a method and system for selectively modulating translation of known `target` genes utilizing the vectors, and a method and system for detecting expression of known `target` genes utilizing the probe.

[0013] By "substantially pure DNA" is meant DNA that is free of the genes which, in the naturally-occurring genome of the organism from which the DNA of the invention is derived, flank the genes discovered and isolated by the present invention. The term therefore includes, for example, a recombinant DNA which is incorporated into a vector, into an autonomously replicating plasmid or virus, or into the genomic DNA of a prokaryote or eukaryote at a site other than its natural site; or which exists as a separate molecule (e.g., a cDNA or a genomic or cDNA fragment produced by PCR or restriction endonuclease digestion) independent of other sequences. It also includes a recom-

binant DNA which is part of a hybrid gene encoding additional polypeptide sequence.

[0014] "Inhibiting translation" is defined as the ability to prevent synthesis of a specific protein encoded by a respective gene, by means of inhibiting the translation of the mRNA of this gene. "Translation inhibitor site" is defined as the minimal DNA sequence sufficient to inhibit translation.

[0015] There is thus provided in accordance with a preferred embodiment of the present invention a bioinformatically detectable novel gene encoding substantially pure DNA wherein RNA encoded by the bioinformatically detectable novel gene is about 18 to about 24 nucleotides in length, and originates from an RNA precursor, which RNA precursor is about 50 to about 120 nucleotides in length, a nucleotide sequence of a first half of the RNA precursor is a partial or accurate inversed reversed sequence of a nucleotide sequence of a second half thereof, a nucleotide sequence of the RNA encoded by the novel gene is a partial or accurate inversed reversed sequence of a nucleotide sequence of a binding site associated with at least one target gene, the novel gene cannot be detected by either of the following: a visually discernable whole body phenotype, and detection of 99.9% of RNA species

shorter than 25 nucleotides expressed in a tissue sample, and a function of the novel gene is bioinformatically deducible.

[0016] There is still further provided in accordance with another preferred embodiment of the present invention a bioinformatically detectable novel gene encoding substantially pure DNA wherein RNA encoded by the bioninformatically detectable novel gene includes a plurality of RNA sections, each of the RNA sections being about 50 to about 120 nucleotides in length, and including an RNA segment, which RNA segment is about 18 to about 24 nucleotides in length, a nucleotide sequence of a first half of each of the RNA sections encoded by the novel gene is a partial or accurate inversed reversed sequence of nucleotide sequence of a second half thereof, a nucleotide sequence of each of the RNA segments encoded by the novel gene is a partial or accurate inversed reversed sequence of the nucleotide sequence of a binding site associated with at least one target gene, and a function of the novel gene is bioinformatically deducible from the following data elements: the nucleotide sequence of the RNA encoded by the novel gene, a nucleotide sequence of the at least one target gene, and function of the at least one target gene.

[0017] There is additionally provided in accordance with another preferred embodiment of the present invention a bioinformatically detectable novel gene encoding substantially pure DNA wherein RNA encoded by the bioinformatically detectable novel gene is about 18 to about 24 nucleotides in length, and originates from an RNA precursor, which RNA precursor is about 50 to about 120 nucleotides in length, a nucleotide sequence of a first half of the RNA precursor is a partial or accurate inversed reversed sequence of a nucleotide sequence of a second half thereof, a nucleotide sequence of the RNA encoded by the novel gene is a partial or accurate inversed reversed sequence of a nucleotide sequence of a binding site associated with at least one target gene, a function of the novel gene is modulation of expression of the at least one target gene, and the at least one target gene does not encode a protein.

[0018] There is moreover provided in accordance with another preferred embodiment of the present invention a bioinformatically detectable novel gene encoding substantially pure DNA wherein the bioinformatically detectable novel gene does not encode a protein, RNA encoded by the bioinformatically detectable novel gene is maternally

transferred by a cell to at least one daughter cell of the cell, a function of the novel gene includes modulation of a cell type of the daughter cell, and the modulation is bioinformatically deducible.

[0019] There is further provided in accordance with another preferred embodiment of the present invention a bioinformatically detectable novel gene encoding substantially pure DNA wherein the bioinformatically detectable novel gene does not encode a protein, a function of the novel gene is promotion of expression of the at lease one target gene, and the at least one target gene is bioinformatically deducible.

[0020] Still further in accordance with a preferred embodiment of the present invention the function of the novel gene is bioinformatically deducible from the following data elements: the nucleotide sequence of the RNA encoded by the bioinformatically detectable novel gene, a nucleotide sequence of the at least one target gene, and a function of the at least one target gene.

[0021] Additionally in accordance with a preferred embodiment of the present invention the RNA encoded by the novel gene complementarily binds the binding site associated with the at least one target gene, thereby modulating ex-

pression of the at least one target gene.

[0022] Moreover in accordance with a preferred embodiment of the present invention the binding site associated with at least one target gene is located in an untranslated region of RNA encoded by the at least one target gene.

[0023] Further in accordance with a preferred embodiment of the present invention the function of the novel gene is selective inhibition of translation of the at least one target gene, which selective inhibition includes complementary hybridization of the RNA encoded by the novel gene to the binding site.

[0024] Still further in accordance with a preferred embodiment of the present invention, the present invention includes a vector including the DNA.

[0025] Additionally in accordance with a preferred embodiment of the present invention, the present invention includes a method of selectively inhibiting translation of at least one gene, including introducing the vector into a cell.

[0026] Moreover in accordance with a preferred embodiment of the present invention the introducing includes utilizing RNAi pathway.

[0027] Further in accordance with a preferred embodiment of the present invention, the present invention includes a gene

expression inhibition system including: the vector and a vector inserter, functional to insert the vector of claim 10 into a cell, thereby selectively inhibiting translation of at least one gene.

[0028] Still further in accordance with a preferred embodiment of the present invention, the present invention includes a probe including the DNA.

[0029] Additionally in accordance with a preferred embodiment of the present invention, the present invention includes a method of selectively detecting expression of at least one gene, including using the probe.

[0030] Moreover in accordance with a preferred embodiment of the present invention, the present invention includes a gene expression detection system including: the probe, and a gene expression detector functional to selectively detect expression of at least one gene.

Brief Description of Drawings

[0055] Fig. 22 is a picture of laboratory results validating the expression of 35 novel genes detected by a bioinformatic gene detection engine constructed and operative in accordance with a preferred embodiment of the present invention, thereby validating the efficacy of the gene detection engine of the present invention;

[0056] Fig. 23A is a schematic representation of an "operon like" cluster of novel gene hairpin sequences detected bioinformatically by a bioinformatic gene detection engine constructed and operative in accordance with a preferred embodiment of the present invention, and non-GAM hairpin useful as negative controls thereto;

[0057] Fig. 23B is a schematic representation of secondary folding of hairpins of the operon-like cluster of Fig. 23A;

[0058] Fig. 23C is a picture of laboratory results demonstrating expression of novel genes of Figs. 23A and 23B, and lack of expression of the negative controls, thereby validating efficacy of bioinformatic detection of GAM genes and GR genes of the present invention, by a bioinformatic gene detection engine constructed and operative in accordance with a preferred embodiment of the present invention;

[0059] Fig. 24A is an annotated sequence of EST72223 comprising known miRNA gene MIR98 and novel gene GAM25, both detected by the gene detection system of the present invention; and Figs. 24B, 24C and 24D are pictures of laboratory results demonstrating laboratory confirmation of expression of known gene MIR98 and of novel bioinformatically detected gene GAM25 respectively, both of Fig. 24A, thus validating the bioinformatic gene detection sys-

tem of the present invention.

Brief Description of Sequences

[0060] A Sequence Listing of genomic sequences of the present invention designated SEQ ID:1 through SEQ ID:20189 is attached to this application. The genomic listing comprises the following nucleotide sequences:Genomic sequences designated SEQ ID:1 through SEQ ID:200 are nucleotide sequences of 200 gene precursors of respective novel genes of the present invention;Genomic sequences designated SEQ ID:201 through SEQ ID:400 are nucleotide sequences of 199 genes of the present invention; and Genomic sequences designated SEQ ID:401 through SEQ ID:20189 are nucleotide sequences of 19789 target gene binding sites.

Detailed Description

[0061] Reference is now made to Fig. 1 which is a simplified diagram providing a conceptual explanation of a genomic differentiation enigma, which the present invention addresses.

[0062] Fig. 1 depicts different cell types in an organism, such as CARTILAGE CELL, LIVER CELL, FIBROBLAST CELL and BONE CELL all containing identical DNA, and deriving from the

initial FERTILIZED EGG CELL, and yet each of these cells expressing different proteins, and hence acquiring different shape and function.

[0063] The present invention proposes that the inevitable conclusion from this constraint is, however, strikingly simple: the coding system used must be modular. It must comprise multiple modules, or records, one for each cell-type, and a mechanism whereby each cell at its inception is instructed which record to open, and behaves according to instructions in that record.

[0064] This modular code concept is somewhat difficult to grasp, since we are strongly habituated to viewing things from an external viewpoint. An architect, for example, looks at a blueprint of a building, which details exactly where each element (block, window, door, electrical switch, etc.) is to be placed relative to all other elements, and then instructs builders to place these elements in their designated places. This is an external viewpoint: the architect is external to the blueprint, which itself is external to the physical building, and its different elements. The architect may therefore act as an "external organizing agent": seeing the full picture and the relationships between all elements, and being able to instruct from the outside where

to place each of them.

[0065] Genomics differentiation coding evidently works differently, without any such external organizing agent: It comprises only one smart block (the first cell), which is the architect and the blueprint, and which continuously duplicates itself, somehow knowing when to manifest itself as a block and when as a window, door, or electrical switch.

[0066] Reference is now made to Figs. 2 through 4 which are schematic diagrams which when taken together provide an analogy that illustrates a conceptual model of the present invention, addressing the genomic differentiation enigma.

[0067] Reference is now made to Fig. 2A. Imagine a very talented chef, capable of preparing any meal provided he is given specific written cooking instructions. This chef is equipped with two items: (a) a thick recipe book, and (b) a small note with a number scribbled on it. The book comprises multiple pages, each page detailing how to prepare a specific meal. The small note indicates the page to be opened, and therefore the meal to be prepared. The chef looks at the page-number written on the note, opens the recipe book at the appropriate page, and prepares the meal according to the written instructions on this page. As

an example, Fig. 2A depicts a CHEF holding a note with the number 12 written on it, he opens the book on page 12, and since that page contains the recipe for preparing BREAD, the CHEF prepares a loaf of BREAD.

[0068] Reference is now made to Fig. 2B, which depicts two identical chefs, CHEF A and CHEF B, holding an identical recipe book. Despite their identity, and the identity of their recipe book, since CHEF A holds a note numbered 12, and therefore opens the book on page 12 and prepares BREAD, whereas CHEF B holds a note numbered 34 and therefore opens the book on page 34 and prepares a PIE.

[0069] Reference is now made to Fig. 3. Imagine the chef of the analogy is also capable of duplicating himself once he has finished preparing the specified meal. The format of the book is such that at the bottom of each page, two numbers are written. When he has finished preparing the meal specified on that page, the chef is trained to do the following: (i) divide himself into two identical duplicate chefs, (ii) duplicate the recipe book and hand a copy to each of his duplicate chefs, and (iii) write down the two numbers found at the bottom of the page of the meal he prepared, on two small notes, handing one note to each of his two duplicate chefs.

[0070] Each of the two resulting duplicate chefs are now equipped with the same book, and have the same talent to prepare any meal, but since each of them received a different note, they will now prepare different meals.

[0071] Fig. 3 depicts CHEF A holding a recipe book and receiving a note numbered 12. CHEF A therefore opens the book on page 12 and prepares BREAD. When he is finished making bread, CHEF A performs the following actions: (i) divides himself into two duplicate chefs, designated CHEF B and CHEF C, (ii) duplicates his recipe book handing a copy to each of CHEF B and CHEF C, (iii) writes down the numbers found at the bottom of page 12, numbers 34 and 57, on two notes, handing note numbered 34 to CHEF B and note numbered 57 to CHEF C.

[0072] Accordingly, CHEF B receives a note numbered 34 and therefore opens the recipe book on page 34 and prepares PIE, whereas CHEF C receives a note numbered 57 and therefore opens the book on page 57 and therefore prepares RICE.

[0073] It is appreciated that while CHEF A, CHEF B & CHEF C are identical and hold identical recipe books, they each prepare a different meal. It is also appreciated that the meals prepared by CHEF B and CHEF C are determined CHEF A,

and are mediated by the differently numbered notes passed on from CHEF A to CHEF B and CHEF C.

[0074] It is further appreciated that the mechanism illustrated by Fig. 3 enables an unlimited lineage of chefs to divide into duplicate, identical chefs and to determine the meals those duplicate chefs would prepare. For example, having been directed to page 34, when CHEF B divides into duplicate chefs (not shown), he will instruct its two duplicate chefs to prepare meals specified on pages 14 and 93 respectively, according to the numbers at the bottom of page 34 to which he was directed. Similarly, CHEF C will instruct its duplicate chefs to prepare meals specified on pages 21 and 46 respectively, etc.

[0075] Reference is now made to Fig. 4. Imagine that the cooking instructions on each page of the recipe book are written in shorthand format: The main meal-page to which the chef was directed by the scribbled note, merely contains a list of numbers which direct him to multiple successive pages, each specifying how to prepare an ingredient of that meal.

[0076] As an example, Fig. 4 depicts CHEF A of FIGS 2 and 3, holding a recipe book and a note numbered 12. Accordingly, CHEF A opens the recipe book on page 12, which details the instructions for preparing BREAD. However, the

"instructions" on making BREAD found on page 12 comprise only of 3 numbers, 18, 7 and 83, which "refer" CHEF A to pages detailing preparation of the ingredients of BREAD FLOUR, MILK and SALT, respectively.

[0077] As illustrated in Fig. 4, turning from the main "meal page" (e.g. 12) to respective "ingredients pages" (e.g. pages 18, 7 & 83) is mediated by scribbled notes with the page-numbers written on them. In this analogy, the scribbled notes are required for seeking the target pages to be turned to both when turning to main "meal pages" (e.g. page 12), as well as when turning to "ingredient pages" (e.g. pages 18, 7 & 83).

[0078] The chef in the given analogy, schematically depicted in FIGS 2 through 4, represents a cell; the thick recipe book represents the DNA; preparing a meal in the given analogy represents the cell manifesting itself as a specific cell-type; and ingredients of a meal represent proteins expressed by that cell-type. Like the chef equipped with the thick recipe book in the given analogy, all cells in an organism contain the same DNA and are therefore each potentially capable of manifesting itself as any cell-type, expressing proteins typical of that cell type.

[0079] Reference is now made to Figs. 5A and 5B which are

schematic diagrams, which when taken together illustrate a "genomic records" concept of the conceptual model of the present invention, addressing the genomic differentiation enigma.

[0080] The Genomic Records concept asserts that the DNA (the thick recipe book in the illustration) comprises a very large number of Genomic Records (analogous to pages in the recipe book), each containing the instructions for differentiation of a different cell-type, or developmental process. Each Genomic Record is headed by a very short genomic sequence which functions as a "Genomic Address" of that Genomic Record (analogous to the page number in the recipe book). At its inception, in addition to the DNA, each cell also receives a short RNA segment (the scribbled note in the illustration). This short RNA segment binds complementarily to a "Genomic Address" sequence of one of the Genomic Records, thereby activating that Genomic Record, and accordingly determining the cell"s-fate (analogous to opening the book on the page corresponding to the number on the scribbled note, thereby determining the meal to be prepared).

[0081] Reference is now made to Fig. 5A. Fig 5A illustrates a CELL which comprises a GENOME. The GENOME comprises a

plurality of GENOMIC RECORDS, each of which correlates to a specific cell type (for clarity only 6 sample genomic records are shown). Each genomic record comprises genomic instructions on differentiation into a specific cell-type, as further elaborated below with reference to Fig. 7. At cell inception, the CELL receives a maternal short RNA segment, which activates one of the GENOMIC RECORDS, causing the cell to differentiate according to the instructions comprised in that genomic record. As an example, Fig. 5A illustrates reception of a maternal short RNA segment designated A" and outlined by a broken line, which activates the FIBRO genomic record, causing the cell to differentiate into a FIBROBLAST CELL.

[0082] Reference is now made to Fig. 5B, which is a simplified schematic diagram, illustrating cellular differentiation mediated by the "Genomic Records" concept. Fig. 5B depicts 2 cells in an organism, designated CELL A and CELL B, each having a GENOME. It is appreciated that since CELL A and CELL B are cells in the same organism, the GENOME of CELL A is identical to that of CELL B. Despite having an identical GENOME, CELL A differentiates differently from CELL B, due to activation of different genomic records in these two cells. In CELL A the FIBRO GENOMIC RECORD is

activated, causing CELL A to differentiate into a FIBROBLAST CELL, whereas in CELL B the BONE GENOMIC RECORD is activated, causing the CELL B to differentiate into a BONE CELL. The cause for activation of different genomic records in these two cells is the different maternal short RNA which they both received: CELL A received a maternal short RNA segment designated A" which activated genomic record FIBRO, whereas CELL B received a maternal short RNA segment designated B" which activated genomic record BONE.

[0083] Reference is now made to Fig. 6 which is a schematic diagram illustrating a "genomically programmed cell differentiation" concept of the conceptual model of the present invention, addressing the genomic differentiation enigma.

[0084] A cell designated CELL A divides into 2 cells designated CELL B and CELL C. CELL A, CELL B and CELL C each comprise a GENOME, which GENOME comprises a plurality of GENOMIC RECORDS. It is appreciated that since CELL A, CELL B and CELL C are cells in the same organism, the GENOME of these cells, and the GENOMIC RECORDS comprised therein, are identical.

[0085] As described above with reference to Fig. 5B, at its inception, CELL A receives a maternal short RNA segment, des-

ignated A" and marked by a broken line, which activates the FIBRO genomic record, thereby causing CELL A to differentiate into a FIBROBLAST CELL. However, Fig. 6 shows further details of the genomic records: each cell genomic record also comprises two short genomic sequences, referred to here as Daughter Cell Genomic Addresses. Blocks designated B and C are Daughter Cell Genomic Addresses of the FIBRO Genomic Record. At cell division, each parent cell transcribes two short RNA segments, corresponding to the two Daughter Cell Genomic Addresses of the Genomic Record of that parent cell, and transfers one to each of its two daughter cells. CELL A of Fig. 6 transcribes and transfers to its two respective daughter cells, two short RNA segments, outlined by a broken line and designated B" and C", corresponding to daughter cell genomic addresses designated B and C comprised in the FIBRO genomic record.

[0086] CELL B therefore receives the above mentioned maternal short RNA segment designated B", which binds complementarily to genomic address designated B of genomic record BONE, thereby activating this genomic record, which in turn causes CELL B to differentiate into a BONE CELL. Similarly, CELL C receives the above mentioned ma-

ternal short RNA segment designated C", which binds complementarily to genomic address designated C of genomic record CARTIL., thereby activating this genomic record, which in turn causes CELL C to differentiate into a CARTILAGE CELL.

[0087] It is appreciated that the mechanism illustrated by Fig. 6 enables an unlimited lineage of cells to divide into daughter cells containing the same DNA, and to determine the cell-fate of these daughter cells. For example, when CELL B and CELL C divide into their respective daughter cells (not shown), they will transfer short RNA segments designated D" & E", and F" & G" respectively, to their respective daughter cells. The cell fate of each of these daughter cells would be determined by the identity of the maternal short RNA segment they receive, which would determine the genomic record activated.

[0088] Reference is now made to Fig. 7 which is a schematic diagram illustrating a "genomically programmed cell-specific protein expression modulation" concept of the conceptual model of the present invention, addressing the genomic differentiation enigma.

[0089] Cell A receives a maternal short RNA segment designated A", which activates a genomic record designated FIBRO, by

anti-sense binding to a binding site "header" of this genomic record, designated A. Genomic record FIBRO encodes 3 short RNA segments, designated 1, 2 and 4 respectively, which modulate expression of target genes designated GENE1, GENE2 and GENE4 respectively. Modulation of expression of these genes results in CELL A differentiating into a FIBROBLAST CELL.

[0090] Reference is now made to Fig. 8, which is a simplified diagram describing each of a plurality of novel bioinformatically detected genes of the present invention, referred to here as Genomic Address Messenger (GAM) genes, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[0091] GAM is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM is detected is described hereinabove with reference to Figs. 8-15.

[0092] GAM GENE and GAM TARGET GENE are human genes contained in the human genome.

[0093] GAM GENE encodes a GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM PRECURSOR RNA does not encode a protein. GAM PRE-

CURSOR RNA folds onto itself, forming GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurately or partially inversed reversed sequence of the nucleotide sequence of the second half thereof. By inversed reversed is meant a sequence which is reversed and wherein each nucleotide is replaced by a complementary nucleotide, as is well known in the art (e.g. ATGGC is the reverse complementary sequence of GCCAT).

[0094] An enzyme complex designated DICER COMPLEX, `dices` the GAM FOLDED PRECURSOR RNA into GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins.

[0095] TARGET GENE encodes a corresponding messenger RNA, GAM TARGET RNA. GAM TARGET RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0096] GAM RNA binds complementarily to one or more target binding sites located in untranslated regions of GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM RNA is a partial or accurate inversed reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM RNA may have a different number of target binding sites in untranslated regions of a GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only, these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0097] The complementary binding of GAM RNA to target binding sites on GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM TARGET RNA into GAM TARGET PROTEIN. GAM TAR-

GET PROTEIN is therefore outlined by a broken line.

[0098] It is appreciated that GAM TARGET GENE in fact represents a plurality of GAM target genes. The mRNA of each one of this plurality of GAM target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM RNA, and which when bound by GAM RNA causes inhibition of translation of respective one or more GAM target proteins.

[0099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM GENE on one or more TARGET GENE, is in fact common to other known miRNA genes, as is well known in the art.

[0100] Nucleotide sequences of each of a plurality of GAM GENEs described by Fig. 8 and their respective genomic source and chromosomal location are further described hereinbelow with reference to Table 1, hereby incorporated by reference.

[0101] Nucleotide sequences of GAM PRECURSOR RNA, and a schematic representation of a predicted secondary folding of GAM FOLDED PRECURSOR RNA, of each of a plurality of GAM GENEs described by Fig. 8 are further described

hereinbelow with reference to Table 2, hereby incorporated by reference.

[0102] Nucleotide sequences of a `diced` GAM RNA of each of a plurality of GAM GENEs described by Fig. 8 are further described hereinbelow with reference to Table 3, hereby incorporated by reference.

[0103] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM TARGET RNA, of each of a plurality of GAM GENEs described by Fig. 8, and schematic representation of the complementarity of each of these target binding sites to each of a plurality of GAM RNA described by Fig. 8 are described hereinbelow with reference to Table 4, hereby incorporated by reference.

[0104] It is appreciated that specific functions and accordingly utilities of each of a plurality of GAM GENEs described by Fig. 8 correlate with, and may be deduced from, the identity of the TARGET GENEs that each of said plurality of GAM GENEs binds and inhibits, and the function of each of said TARGET GENEs, as elaborated hereinbelow.Studies establishing known functions of each of a plurality of TARGET GENEs of GAM GENEs of Fig. 8, and correlation of said each of a plurality of TARGET GENEs to known dis-

eases are listed in Table 5, and are hereby incorporated by reference.

[0105] The present invention discloses a novel group of genes, the GAM genes, belonging to the miRNA genes group, and for which a specific complementary binding has been determined.

[0106] Reference is now made to Fig. 9 which is a simplified block diagram illustrating a bioinformatic gene detection system capable of detecting genes of the novel group of genes of the present invention, which system is constructed and operative in accordance with a preferred embodiment of the present invention.

[0107] A centerpiece of the present invention is a bioinformatic gene detection engine 100, which is a preferred implementation of a mechanism capable of bioinformatically detecting genes of the novel group of genes of the present invention.

[0108] The function of the bioinformatic gene detection engine 100 is as follows: it receives three types of input, expressed RNA data 102, sequenced DNA data 104, and protein function data 106, performs a complex process of analysis of this data as elaborated below, and based on this analysis produces output of a bioinformatically de-

tected group of novel genes designated 108.

[0109] Expressed RNA data 102 comprises published expressed sequence tags (EST) data, published mRNA data, as well as other sources of published RNA data. Sequenced DNA data 104 comprises alphanumeric data describing sequenced genomic data, which preferably includes annotation data such as location of known protein coding regions relative to the sequenced data. Protein function data 106 comprises scientific publications reporting studies which elucidated physiological function known proteins, and their connection, involvement and possible utility in treatment and diagnosis of various diseases. Expressed RNA data 102 and sequenced DNA data 104 may preferably be obtained from data published by the National Center for Bioinformatics (NCBI) at the National Institute of Health (NIH) (Jenuth, 2000), as well as from various other published data sources. Protein function data 106 may preferably be obtained from any one of numerous relevant published data sources, such as the Online Mendelian Inherited Disease In Man (OMIM(TM)) database developed by John Hopkins University, and also published by NCBI (2000).

[0110] Prior to actual detection of bioinformatically detected

novel genes 108 by the bioinformatic gene detection engine 100, a process of bioinformatic gene detection engine training & validation designated 110 takes place. This process uses the known miRNA genes as a training set (some 200 such genes have been found to date using biological laboratory means), to train the bioinformatic gene detection engine 100 to bioinformatically recognize miRNA-like genes, and their respective potential target binding sites. Bioinformatic gene detection engine training & validation 110 is further described hereinbelow with reference to Fig. 10.

[0111] The bioinformatic gene detection engine 100 comprises several modules which are preferably activated sequentially, and are described as follows:

[0112] A non-coding genomic sequence detector 112 operative to bioinformatically detect non-protein coding genomic sequences. The non-coding genomic sequence detector 112 is further described herein below with reference to Figs. 11A and 11B.

[0113] A hairpin detector 114 operative to bioinformatically detect genomic `hairpin-shaped` sequences, similar to GAM FOLDED PRECURSOR of Fig. 8. The hairpin detector 114 is further described herein below with reference to Figs. 12A

and 12B.

[0114] A dicer-cut location detector 116 operative to bioinformatically detect the location on a hairpin shaped sequence which is enzymatically cut by DICER COMPLEX of Fig. 8. The dicer-cut location detector 116 is further described herein below with reference to Fig. 13A.

[0115] A target-gene binding-site detector 118 operative to bioinformatically detect target genes having binding sites, the nucleotide sequence of which is partially complementary to that of a given genomic sequence, such as a sequence cut by DICER COMPLEX of Fig. 8. The target-gene binding-site detector 118 is further described hereinbelow with reference to Figs. 14A and 14B.

[0116] A function & utility analyzer 120 operative to analyze function and utility of target genes, in order to identify target genes which have a significant clinical function and utility. The function & utility analyzer 120 is further described hereinbelow with reference to Fig. 15.

[0117] Hardware implementation of the bioinformatic gene detection engine 100 is important, since significant computing power is preferably required in order to perform the computation of bioinformatic gene detection engine 100 in reasonable time and cost. For example, it is estimated

that a using a powerful 8-processor server (e.g. DELL POWEREDGE (TM) 8450, 8 XEON (TM) 550MHz processors, 8 GB RAM), over 6 years (!) of computing time are required to detect all MIR genes in the human EST data, together with their respective binding sites. Various computer hardware and software configurations may be utilized in order to address this computation challenge, as is known in the art. A preferred embodiment of the present invention may preferably comprise a hardware configuration, comprising a cluster of one hundred PCs (PENTIUM (TM) IV, 1.7GHz, with 40GB storage each), connected by Ethernet to 12 servers (2-CPU, XEON (TM) 1.2-2.2GHz, with ~200GB storage each), combined with an 8-processor server (8-CPU, Xeon 550Mhz w/ 8GB RAM) connected via 2 HBA fiber-channels to an EMC CLARIION (TM) 100-disks, 3.6 Terabyte storage device. A preferred embodiment of the present invention may also preferably comprise a software configuration which utilizes a commercial database software program, such as MICROSOFT (TM) SQL Server 2000. Using such preferred hardware and software configuration, may reduce computing time required to detect all MIR genes in the human EST data, and their respective binding sites, from 6 years to 45 days. It

is appreciated that the above mentioned hardware configuration is not meant to be limiting, and is given as an illustration only. The present invention may be implemented in a wide variety of hardware and software configurations.

[0118] The present invention discloses 200 novel genes of the GAM group of genes, which have been detected bioinformatically, as described hereinbelow with reference to Table 1 through Table 4, and 1096 novel genes of the GR group of genes, which have been detected bioinformatically. Laboratory confirmation of 50 bioinformatically predicted genes of the GAM group of genes, and several bioinformatically predicted genes of the GR group of genes, is described hereinbelow with reference to Figs. 21 through 24D.

[0119] Reference is now made to Fig. 10 which is a simplified flowchart illustrating operation of a mechanism for training a computer system to recognize the novel genes of the present invention. This mechanism is a preferred implementation of the bioinformatic gene detection engine training & validation 110 described hereinabove with reference to Fig. 9.

[0120] BIOINFORMATIC GENE DETECTION ENGINE TRAINING &

VALIDATION 110 of Fig. 9 begins by training the bioinformatic gene detection engine to recognize known miRNA genes, as designated by numeral 122. This training step comprises HAIRPIN DETECTOR TRAINING & VALIDATION 124, further described hereinbelow with reference to Fig. 12A, DICER-CUT LOCATION DETECTOR TRAINING & VALIDATION 126, further described hereinbelow with reference to Fig. 13A and 13B, and TARGET-GENE BINDING-SITE DETECTOR TRAINING & VALIDATION 128, further described hereinbelow with reference to Fig. 14A.

[0121] Next, the BIOINFORMATIC GENE DETECTION ENGINE 100 is used to bioinformatically detect sample novel genes, as designated by numeral 130. Examples of sample novel genes thus detected are described hereinbelow with reference to Figs. 21 through 24D. Finally, wet lab experiments are preferably conducted in order to validate expression and preferably function of the sample novel genes detected by the BIOINFORMATIC GENE DETECTION ENGINE 100 in the previous step. An example of wet-lab validation of the above mentioned sample novel gene bioinformatically detected by the system is described hereinbelow with reference to Fig. 22

[0122] Reference is now made to Fig. 11B which is a simplified

flowchart illustrating a preferred operation of the NON-CODING GENOMIC SEQUENCE DETECTOR 112 of Fig. 9. Detection of NON-PROTEIN CODING GENOMIC SEQUENCES 136, generally preferably progresses in one of the following two paths:

[0123] A first path for detecting NON-PROTEIN CODING GENOMIC SEQUENCES 136 begins by receiving a plurality of known RNA sequences, such as EST data. Each RNA sequence is first compared to all known protein-coding sequences, in order to select only those RNA sequences which are non-protein coding, i.e. intergenic or intronic. This can preferably be performed by sequence comparison of the RNA sequence to known protein coding sequences, using one of many alignment algorithms known in the art, such as BLAST. This sequence comparison to the DNA preferably also provides the localization of the RNA sequence on the DNA.

[0124] Alternatively, selection of non-protein coding RNA sequences and their localization to the DNA can be performed by using publicly available EST clusters data and genomic mapping databases, such as UNIGENE database published by NCBI or TIGR database, in order map expressed RNA sequences to DNA sequences encoding

them, to find the right orientation of EST sequences, and to exclude ESTs which map to protein coding DNA regions, as is well known in the art. Public databases, such as TIGR, may also be used to map an EST to a cluster of ESTs, assumed to be expressed as one piece, and is known in the art as Tentative Human Consensus. Publicly available genome annotation databases, such as NCBI"s GENBANK, may also be used to deduce expressed intronic sequences.

[0125] Optionally, an attempt may be made to "expand" the non-protein RNA sequences thus found, by searching for transcription start and end signals, upstream and downstream of location of the RNA on the DNA respectively, as is well known in the art.

[0126] A second path for detecting non-protein coding genomic sequences starts by receiving DNA sequences. The DNA sequences are parsed into non protein coding sequences, based on published DNA annotation data, by extracting those DNA sequences which are between known protein coding sequences. Next, transcription start and end signals are sought. If such signals are found, and depending on their "strength", probable expressed non-protein coding genomic sequences are yielded. Such approach is es-

pecially useful for identifying novel GAM genes which are found in proximity to other known miRNA genes, or other wet-lab validated GAM genes. Since, as described hereinbelow with reference to Fig. 16, GAM genes are frequently found in clusters, therefore sequences near a known miRNA are more likely to contain novel GAM genes. Optionally, sequence orthology, i.e. sequences conservation in an evolutionary related species, may be used to select genomic sequences having higher probability of containing expressed novel GAM genes.

[0127] Reference is now made to Fig. 12A which is a simplified block diagram of a preferred implementation of the HAIRPIN DETECTOR 114 described hereinabove with reference to Fig. 9.

[0128] The goal of the HAIRPIN DETECTOR 114 is to detect "hairpin" shaped genomic sequences, similar to those of known miRNA genes. As mentioned hereinabove with reference to Fig. 8, a "hairpin" genomic sequence refers to a genomic sequence which "folds onto itself" forming a hairpin like shape, due to the fact that nucleotide sequence of the first half of the nucleotide sequence is an accurate or partial complementary sequence of the nucleotide sequence of its second half.

[0129] The HAIRPIN DETECTOR 114 of Fig. 9 receives as input a plurality of NON-PROTEIN CODING GENOMIC SEQUENCES 136 of Fig. 11A. After a phase of HAIRPIN DETECTOR TRAINING & VALIDATION 124 of Fig. 10, the HAIRPIN DETECTOR 114 is operative to detect and output "hairpin shaped" sequences, which are found in the input NON-PROTEIN CODING GENOMIC SEQUENCES 138. The hairpin shaped sequences detected by the HAIRPIN DETECTOR 114 are designated HAIRPINS ON GENOMIC SEQUENCES 138. Preferred operation of the HAIRPIN DETECTOR 114 is described hereinbelow with reference to Fig. 12B.

[0130] The phase of HAIRPIN DETECTOR TRAINING & VALIDATION 124 is an iterative process of applying the HAIRPIN DETECTOR 114 to known hairpin shaped miRNA genes, calibrating the HAIRPIN DETECTOR 114 such that it identifies the training set of known hairpins, as well as sequences which are similar thereto. In a preferred embodiment of the present invention, THE HAIRPIN DETECTOR TRAINING & VALIDATION 124 trains and validates each of the steps of operation of the HAIRPIN DETECTOR 114, which steps are described hereinbelow with reference to Fig. 12B.

[0131] The hairpin detector training and validation 124 preferably uses two sets of data: a training set of known miRNA

genes, such as 440 miRNA genes of H. sapiens, M. musculus, C. elegans, C. Brigssae and D. Melanogaster, annotated in RFAM database (Griffiths-Jones 2003), and a large "background set" of hairpins found in expressed non-protein coding genomic sequences, such as a set of 21,985 hairpins found in Tentative Human Concensus (THC) sequences in TIGR database. The "background set" is expected to comprise some valid, previously undetected miRNA hairpins, and many hairpins which are not miRNA hairpins.

[0132] In order to validate the performance of the HAIRPIN DETECTOR 114, a validation method is preferably used, which validation method is a variation on the k-fold cross validation method (Mitchell, 1997). This preferred validation method is devised to better cope with the nature of the training set, which includes large families of similareven identical miRNAs. The training set is preferably first divided into clusters of miRNAs such that any two miRNAs that belong to different clusters have an Edit Distance score (see Algorithms and Strings, Dan Gusfield, Cambridge University Press, 1997) of at least D=3, i.e. they differ by at least 3 editingNext, the group of clusters is preferably divided into k sets. Then standard k-fold

cross validation is preferably performed on this group of clusters, preferably using k=5, such that the members of each cluster are all in the training set or in the test set. It is appreciated that without the prior clustering, standard cross validation methods results in much higher performance of the predictors due to the redundancy of training examples, within the genome of a species and across genomes of different species.

[0133] In a preferred embodiment of the present invention, using the abovementioned validation method, the efficacy of the HAIRPIN DETECTOR 114 is indeed validated: for example, when a similarity threshold is chosen such that 90% of the published miRNA-precursor hairpins are successfully predicted, only 7.6% of the 21,985 background hairpins are predicted to be miRNA-precursors, some of which may indeed be previously unknown miRNA precursors.

[0134] Reference is now made to Fig. 12B which is a simplified flowchart illustrating a preferred operation of the HAIRPIN DETECTOR 114 of Fig. 9.

[0135] A hairpin structure is a secondary structure, resulting from the nucleotide sequence pattern: the nucleotide sequence of the first half of the hairpin is a partial or accurate inversed reversed sequence of the nucleotide se-

quence of the second half thereof. Various methodologies are known in the art for prediction of secondary and tertiary hairpin structures, based on given nucleotide sequences.

[0136] In a preferred embodiment of the present invention, the HAIRPIN DETECTOR 114 initially calculates possible secondary structure folding patterns of a given one of the non-protein coding genomic sequences 136 and the respective energy of each of these possible secondary folding patterns, preferably using a secondary structure folding algorithm based on free-energy minimization, such as the MFOLD algorithm (Mathews et al., 1999), as is well known in the art.

[0137] Next, the HAIRPIN DETECTOR 114 analyzes the results of the secondary structure folding, in order to determine the presence, and location of hairpin folding structures. A secondary structure folding algorithm, such as MFOLD algorithm, typically provides as output a listing of the base-pairing of the folded shape, i.e. a listing of each pair of connected nucleotides in the sequence. The goal of this second step is to asses this base-pairing listing, in order to determine if it describes a hairpin type bonding pattern. Preferably, each of the sequences that is determined

to describe a hairpin structure is folded separately in order to determine its exact folding pattern and free-energy.

[0138] The HAIRPIN DETECTOR 114 then assess those hairpin structures found by the previous step, comparing them to hairpins of known miRNA genes, using various characteristic hairpin features such as length of the hairpin and of its loop, free-energy and thermodynamic stability, amount and type of mismatched nucleotides, existence of sequence repeat-elements. Only hairpins that bear statistically significant resemblance to the training set of known miRNA hairpins, according to the abovementioned parameters are accepted.

[0139] In a preferred embodiment of the present invention, similarity to the training set of known miRNA hairpins is determined using a "similarity score" which is calculated using a weighted sum of terms, where each term is a function of one of the abovementioned hairpin features, and the parameters of each function are learned from the set of known hairpins, as described hereinabove with reference to hairpin detector training & validation 124. The weight of each term in the similarity score is optimized so as to achieve maximal separation between the distribution

of similarity scores of hairpins which have been validated as miRNA-precursor hairpins, and the distribution of similarity scores of hairpins detected in the "background set" mentioned hereinabove with reference to Fig. 12B, many of which are expected not to be miRNA-precursor hairpins.

[0140] In another preferred embodiment of the present invention, the abovementioned DETERMINE IF SIMILAR TO KNOWN HAIRPIN-GENES step may may preferably be split into two stages. The first stage is a permissive filter that implements a simplified scoring method, based on a subset of the hairpin features described hereinabove, such as minimal length and maximal free energy. The second stage is more stringent, and a full calculation of the weighted sum of terms described hereinabove is performed. This second stage may preferably be performed only on the subset of hairpins that survived prior filtering stages of the hairpin-detector 114.

[0141] Lastly, the HAIRPIN DETECTOR 114 attempts to select those hairpin structures which are as thermodynamically stable as the hairpins of known miRNA genes. This may preferably be achieved in various manners. A preferred embodiment of the present invention utilizes the follow-

ing methodology preferably comprising three logical steps:

[0142] First, the HAIRPIN DETECTOR 114 attempts to group potential hairpins into "families" of closely related hairpins. As is known in the art, a free-energy calculation algorithm, typically provides multiple "versions" each describing a different possible secondary structure folding pattern for the given genomic sequence, and the free energy of such possible folding. The HAIRPIN DETECTOR 114 therefore preferably assesses all hairpins found in each of the "versions", grouping hairpins which appear in different versions, but which share near identical locations into a common "family" of hairpins. For example, all hairpins in different versions, the center of which hairpins is within 7 nucleotides of each other may preferably be grouped to a single "family". Hairpins may also be grouped to a single "family" if the sequences of one or more hairpins are identical to, or are subsequences of, the sequence of another hairpin.

[0143] Next, hairpin "families" are assessed, in order to select only those families which represent hairpins that are as stable as those of known miRNA hairpins. Preferably only families which are represented in a majority of the sec-

ondary structure folding versions, such as at least in 65% or 80% or 100% of the secondary structure folding versions, are considered stable.

[0144] Finally, an attempt is made to select the most suitable hairpin from each selected family. For example, a hairpin which appears in more versions than other hairpins, and in versions the free-energy of which is lower, may be preferred.

[0145] In another preferred embodiment of the present invention, hairpins with homology to other species, and clusters of thermodynamically stable hairpin are further favored.

[0146] Reference is now made to Fig. 13A which is a simplified block diagram of a preferred implementation of the DICER-CUT LOCATION DETECTOR 116 described hereinabove with reference to Fig. 9.

[0147] The goal of the DICER-CUT LOCATION DETECTOR 116 is to detect the location in which DICER COMPLEX of Fig. 8, comprising the enzyme Dicer, would "dice" the given hairpin sequence, similar to GAM FOLDED PRECURSOR RNA, yielding GAM RNA both of Fig. 8.

[0148] The DICER-CUT LOCATION DETECTOR 116 of Fig. 9 therefore receives as input a plurality of HAIRPINS ON GENOMIC

SEQUENCES 138 of Fig. 12A, which were calculated by the previous step, and after a phase of DICER-CUT LOCATION DETECTOR TRAINING & VALIDATION 126, is operative to detect a respective plurality of DICER-CUT SEQUENCES FROM HAIRPINS 140, one for each hairpin.

[0149] In a preferred embodiment of the present invention, the DICER-CUT LOCATION DETECTOR 116 preferably uses standard machine learning techniques such as K nearest-neighbors, Bayesian networks and Support Vector Machines (SVM), trained on known dicer-cut locations of known miRNA genes in order to predict dicer-cut locations of novel GAM genes. TheDICER-CUT LOCATION DETECTOR TRAINING & VALIDATION 126 is further described hereinbelow with reference to Fig. 13B.

[0150] Reference is now made to Fig. 13B which is a simplified flowchart illustrating a preferred implementation of DICER-CUT LOCATION DETECTOR TRAINING & VALIDATION 126 of Fig. 10.

[0151] The general goal of the DICER-CUT LOCATION DETECTOR TRAINING & VALIDATION 126 is to analyze known hairpin shaped miRNA-precursors and their respective dicer-cut miRNA, in order to determine a common pattern to the dicer-cut location of known miRNA genes. Once such a

common pattern is deduced, it may preferably be used by the DICER-CUT LOCATION DETECTOR 116, in detecting the predicted DICER-CUT SEQUENCES FROM HAIRPINS 140, from the respective HAIRPINS ON GENOMIC SEQUENCES 138, all of Fig. 13A.

[0152] First, the dicer-cut location of all known miRNA genes is obtained and studied, so as to train the DICER-CUT LOCATION DETECTOR 116: for each of the known miRNA, the location of the miRNA relative to its hairpin-shaped miRNA-precursor is noted.

[0153] The 5" and 3' ends of the dicer-cut location of each of the known miRNA genes is represented relative to the respective miRNA precursor hairpin, as well as to the nucleotides in each location along the hairpin. Frequency and identity of nucleotides and of nucleotide-pairing, and position of nucleotides and nucleotide pairing relative to the dicer-cut location in the known miRNA precursor hairpins is analyzed and modeled. In a preferred embodiment of the present invention, features learned from published miRNAs include: distance from hairpin"s loop, nucleotide content, positional distribution of nucleotides and mismatched-nucleotides, and symmetry of mismatched-nucleotides.

[0154] Different techniques are well known in the art of machine learning for analysis of existing pattern from a given "training set" of examples, which techniques are then capable, to a certain degree, to detect similar patterns in other, previously unseen examples. Such machine learning techniques include, but are not limited to neural networks, Bayesian networks, Support Vector Machines (SVM), Genetic Algorithms, Markovian modeling, Maximum Likly-hood modeling, Nearest Neighbor algorithms, Decision trees and other techniques, as is well known in the art.

[0155] The DICER-CUT LOCATION DETECTOR 116 preferably uses such standard machine learning techniques to predict either the 5" end or both the 5" and 3" ends of the miRNA excised, or "diced" by the Dicer enzyme from the miRNA hairpin shaped precursor, based on known pairs of miRNA-precursors and their respective resulting miRNAs. The nucleotide sequences of 440 published miRNA and their corresponding hairpin precursors are preferably used for training and evaluation of the dicer-cut location detector module. AAmir-964985515the set of 440 published miRs has all precursors. Akso, we do no longer split into two disjoint sets, but use k-fold cross validation.

[0156] Using the abovementioned training set, machine learning

predictors, such as a Support Vector Machine (SVM) predictor, are implemented, which predictors test every possible nucleotide on a hairpin as a candidate for being the 5" end or the 3" end of a miRNA. Other machine learning predictors include predictors based on Nearest Neighbor, Bayesian modeling, and K-nearest-neighbor algorithms. The training set of the published miRNA precursor sequences is preferably used for training multiple separate classifiers or predictors, each of which produces a model for the 5" or 3" end of a miRNA relative to its hairpin precursor. The models take into account various miRNA properties such as the distance of the respective (3" or 5") end of the miRNA from the hairpin"s loop, the nucleotides at its vicinity and the local "bulge" (i.e. base-pair mismatch) structure.

[0157] Performance of the resulting predictors, evaluated on the abovementioned validation set of 440 published miRNAs using k-fold cross validation (Mitchell, 1997) with k = 3, is found to be as follows: in 70% of known miRNAs 5"-end location is correctly determined by an SVM predictor within up to 2 nucleotides; a Nearest Neighbor (EDIT DISTANCE) predictor achieves 53% accuracy (233/440); a Two-Phased predictor that uses Baysian modeling (TWO

PHASED) achieves 79% accuracy (348/440), when only the first phase is used, and 63% (277/440) when both phases are used; a K-nearest-neighbor predictor (FIRST-K) achieves 61% accuracy (268/440). The accuracies of all predictors are considerably higher on top scoring subsets of published miRNA.

[0158] Finally, in order to validate the efficacy and accuracy of the dicer-cut location detector 116, a sample of novel genes detected thereby is preferably selected, and validated by wet lab. Laboratory results validating the efficacy of the dicer-cut location detector 116 are described hereinbelow with reference to Figs. 21 through 24D.

[0159] Reference is now made to Fig. 13C which is a simplified flowchart illustrating operation of DICER-CUT LOCATION DETECTOR 116 of Fig. 9, constructed and operative in accordance with a preferred embodiment of the present invention.

[0160] The DICER CUT LOCATION DETECTOR 116 is a machine learning computer program module, which is trained on recognizing dicer-cut location of known miRNA genes, and based on this training, is operable to detect dicer cut location of novel GAM FOLDED PRECURSOR RNA. In a preferred embodiment of the present invention, the dicer-cut

location module preferably utilizes machine learning algorithms, such as Support Vector Machine (SVM), Bayesian modeling, Nearest Neighbors, and K-nearest-neighbor, as is well known in the art.

[0161] When assessing a novel GAM precursor, all 19-24 nucleotide long segments comprised in the GAM precursor are initially considered as "potential GAMs", since the dicer-cut location is initially unknown.

[0162] For each such potential GAM, its 5" end, or its 5" and 3" ends are scored by two or more recognition classifiers or predictors.

[0163] In a preferred embodiment of the present invention, the DICER-CUT LOCATION DETECTOR 116 preferably uses a Support Vector Machine predictor trained on features such as distance from hairpin"s loop, nucleotide content, positional distribution of nucleotides and mismatched-nucleotides, and symmetry of mismatched-nucleotides.

[0164] In another preferred embodiment of the present invention, the DICER-CUT LOCATION DETECTOR 116 preferably uses an "EDIT DISTANCE" predictor, which seeks sequences that are similar to those of published miRNAs, utilizing the Nearest Neighbor algorithm, where the similarity metric between two sequences is a variant of the

edit distance algorithm (Algorithms and Strings, Dan Gusfield, Cambridge University Press, 1997). This predictor is based on the observation that miRNAs tend to form clusters (Dostie, 2003), the members of which show marked sequence similarity to each other.

[0165] In yet another preferred embodiment of the present invention, the DICER-CUT LOCATION DETECTOR 116 preferably uses a "TWO PHASED" predictor, which predicts the dicer-cut location in two distinct phases: (a) selecting the double-stranded segment of the hairpin comprising the miRNA by naïve Bayesian modeling (Mitchell, 1997), and (b) detecting which strand contains the miRNA by either naïve or by K-nearest-neighbor modeling. The latter is a variant of the 'FIRST-K' predictor described herein below, with parameters optimized for this specific task. The 'TWO PHASED' predictor may be operated in two modes: either utilizing only the first phase and thereby producing two alternative dicer-cut location predictions, or utilizing both phases and thereby producing only one final dicer-cut location.

[0166] In still another preferred embodiment of the present invention, the DICER-CUT LOCATION DETECTOR 116 preferably uses a "FIRST-K" predictor, which utilizes the

K-nearest-neighbor algorithm. The similarity metric between any two sequences is 1- E/L , where L is a parameter, preferably 8-10 and E is the edit distance between the two sequences, taking into account only the first L nucleotides of each sequence. If the K-nearest-neighbor scores of two or more locations on the hairpin are not significantly different, these locations are further ranked by a Bayesian model, similar to the one described hereinabove.

[0167] Scores of two or more of the abovementioned classifiers or predictors are integrated, yielding an integrated score for each "potential GAM". As an example, Fig. 13C illustrates integration of scores from two classifiers, a 3" end recognition classifier and a 5" end recognition classifier, the scores of which are integrated to yield an integrated score. In a preferred embodiment of the present invention, INTEGRATED SCORE of 13C preferably implements a "best-of-breed" approach, accepting only "potential GAMs" that score highly on one of the above mentioned EDIT DISTANCE", or "TWO-PHASED" predictors. In this context, "high scores" means scores which have been demonstrated to have low false positive value when scoring known miRNAs.

[0168] The INTEGRATED SCORE is then evaluated as follows: (a) the "potential GAM" having the highest score is taken to be the most probable GAM, and (b) if the integrated score of this "potential GAM" is higher than a pre-defined threshold, then the potential GAM is accepted as the PREDICTED GAM.

[0169] Reference is now made to Fig. 14A which is a simplified block diagram of a preferred implementation of the TARGET-GENE BINDING-SITE DETECTOR 118 described hereinabove with reference to Fig. 9. The goal of the TARGET-GENE BINDING-SITE DETECTOR 118 is to detect a BINDING SITE of Fig. 8, including binding sites located in untranslated regions of the RNA of a known gene, the nucleotide sequence of which BINDING SITE is a partial or accurate inversed reversed sequence to that of a GAM RNA of Fig. 8, thereby determining that the above mentioned known gene is a target gene of GAM of Fig. 8.

[0170] The TARGET-GENE BINDING-SITE DETECTOR 118 of Fig. 9 therefore receives as input a plurality of DICER-CUT SEQUENCES FROM HAIRPINS 140 of Fig. 13A which were calculated by the previous step, and a plurality of POTENTIAL TARGET GENE SEQUENCES 142 which derive from SEQUENCED DNA DATA 104 of Fig. 9, and after a phase of

TARGET-GENE BINDING-SITE DETECTOR TRAINING & VALIDATION 128 is operative to detect a plurality of POTENTIAL NOVEL TARGET-GENES HAVING BINDING SITE/S 144 the nucleotide sequence of which is a partial or accurate inversed reversed sequence to that of each of the plurality of DICER-CUT SEQUENCES FROM HAIRPINS 140. Preferred operation of the TARGET-GENE BINDING-SITE DETECTOR 118 is further described hereinbelow with reference to Fig. 14B.

[0171] Reference is now made to Fig. 14B which is a simplified flowchart illustrating a preferred operation of the target-gene binding-site detector 118 of Fig. 9.

[0172] In a preferred embodiment of the present invention, the target-gene binding-site detector 118 first uses a sequence comparison algorithm such as BLAST in order to compare the nucleotide sequence of each of the plurality of dicer-cut sequences from hairpins 140, to the potential target gene sequences 142, such a untranslated regions of known mRNAs, in order to find crude potential matches. Alternatively, the sequence comparison may preferably be performed using a sequence match search tool that is essentially a variant of the EDIT DISTANCE algorithm described hereinabove with reference to Fig. 13C,

and the Nearest Neighbor algorithm (Mitchell, 1997).

[0173] Results of the sequence comparison, performed by BLAST or other algorithms such as EDIT DISTANCE, are then filtered, preferably utilizing BLAST or EDIT DISTANCE score, to results which are similar to those of known binding sites (e.g. binding sites of miRNA genes Lin-4 and Let-7 to target genes Lin-14, Lin-41, Lin 28 etc.). Next the binding site is expanded, checking if nucleotide sequenced immediately adjacent to the binding site found by the sequence comparison algorithm (e.g. BLAST or EDIT DISTANCE), may improve the match. Suitable binding sites, then are computed for free-energy and spatial structure. The results are analyzed, accepting only those binding sites, which have free-energy and spatial structure similar to that of known binding sites. Since known binding sites of known miRNA genes frequently have multiple adjacent binding sites on the same target RNA, accordingly binding sites which are clustered are strongly preferred. Binding sites found in evolutionarily conserved sequences may preferably also be preferred.

[0174] For each candidate binding site a score, Binding Site Prediction Accuracy, is calculated which estimates their similarity of its binding to that of known binding sites. This

score is based on GAM binding site folding features including, but not limited to the free-energy , the total number and distribution of base pairs, the total number and distribution of unpaired nucleotides.

[0175] In another preferred embodiment of the present invention binding sites are searched by a reversed process: sequences of K (preferably 22) nucleotides of the untranslated regions of the target gene are assessed as potential binding sites. A sequence comparison algorithm, such as BLAST or EDIT DISTANCE, is then used to search for partially or accurately complementary sequences elsewhere in the genome, which complementary sequences are found in known miRNA genes or computationally predicted GAM genes. Only complementary sequences, the complementarity of which withstands the spatial structure and free energy analysis requirements described above are accepted. Clustered binding sites are strongly favored, as are potential binding sites and potential GAM genes which occur in evolutionarily conserved genomic sequences.

[0176] Target binding sites, identified by the TARGET-GENE BINDING-SITE DETECTOR 118, are divided into 3 groups: a) comprises binding sites that are exactly complementary to the predicted GAM. b) and c) comprise binding sites

that are not exactly complementary to the predicted GAM: b) has binding sites with 0.9 < Binding Site Prediction Accuracy <= 1 and c) has binding sites with 0.8 < Binding Site Prediction Accuracy <= 0.9 . The average number of mismatching nucleotides in the alignment of predicted GAM and target binding site is smallest in category a and largest in category c.

[0177] In a preferred embodiment of the current invention a ranking of GAM to target gene binding is performed by calculating a score, Mir Target Accuracy. This score is the dominant group identifier of all binding sites of a specific GAM to a specific target gene UTR, where 'a' dominates 'b' and 'b' dominates 'c'.

[0178] In yet another preferred embodiment of the current invention a ranking of GAM to target gene binding is performed directly from the set of Binding Site Prediction Accuracies corresponding to all the binding sites of a specific GAM to a specific target gene UTR. This set of scores is sorted in descending order. The final score is a weighted sum of these scores where the weights are exponentially decreasing as a function of the rank.

[0179] Reference is now made to Fig. 15 which is a simplified flowchart illustrating a preferred operation of the function

& utility analyzer 120 described hereinabove with reference to Fig. 9. The goal of the function & utility analyzer 120 is to determine if a potential target gene is in fact a valid clinically useful target gene. Since a potential novel GAM gene binding a binding site in the UTR of a target gene is understood to inhibit expression of that target gene, and if that target gene is shown to have a valid clinical utility, then in such a case it follows that the potential novel gene itself also has a valid useful function which is the opposite of that of the target gene.

[0180] The function & utility analyzer 120 preferably receives as input a plurality of potential novel target genes having binding-site/s 144, generated by the target-gene binding-site detector 118, both of Fig. 14A. Each potential gene is evaluated as follows:First, the system checks to see if the function of the potential target gene is scientifically well established. Preferably, this can be achieved bioinformatically by searching various published data sources presenting information on known function of proteins. Many such data sources exist and are published as is well known in the art.Next, for those target genes the function of which is scientifically known and is well documented, the system then checks if scientific research data

exists which links them to known diseases. For example, a preferred embodiment of the present invention utilizes the OMIM(TM) database published by NCBI, which summarizes research publications relating to genes which have been shown to be associated with diseases.Finally, the specific possible utility of the target gene is evaluated. While this process too may be facilitated by bioinformatic means, it might require manual evaluation of published scientific research regarding the target gene, in order to determine the utility of the target gene to the diagnosis and or treatment of specific disease. Only potential novel genes, the target-genes of which have passed all three examinations, are accepted as novel genes.

[0181] Reference is now made to Fig. 16, which is a simplified diagram describing each of a plurality of novel bioinformatically detected regulatory genes, referred to here as Genomic Record (GR) genes, which encodes an `operon-like` cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.GR GENE is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR GENE was detected is de-

scribed hereinabove with reference to Figs. 9-18.GR GENE encodes GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long. GR PRECURSOR RNA folds spatially, forming GR FOLDED PRECURSOR RNA. It is appreciated that GR FOLDED PRECURSOR RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR PRECURSOR RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accurate inversed reversed sequence of the second half thereof, as is well known in the art. GR FOLDED PRECURSOR RNA is naturally processed by cellular enzymatic activity into separate GAM precursor RNAs, herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA

of Fig. 8.GAM1 RNA, GAM2 RNA and GAM3 RNA, each bind complementarily to binding sites located in untranslated regions of respective target genes, designated GAM1-TARGET RNA, GAM2-TARGET RNA and GAM3-TARGET RNA, respectively, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. This binding inhibits translation of the respective target proteins designated GAM1-TARGET PROTEIN, GAM2-TARGET PROTEIN and GAM3-TARGET PROTEIN respectively.It is appreciated that specific functions, and accordingly utilities, of each GR GENE of the present invention, correlates with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of said GR GENE, schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN.

[0182] The present invention discloses 1096 novel genes of the GR group of genes, which have been detected bioinformatically. Laboratory confirmation of 2 genes of the GR group of genes is described hereinbelow with reference to Figs. 23A through 24D.

[0183] In summary, the current invention discloses a very large

number of novel GR genes, each of which encodes a plurality of GAM genes, which in turn may modulate expression of a plurality of target proteins. It is appreciated therefore that the function of GR genes is in fact similar to that of the Genomic Records concept of the present invention addressing the differentiation enigma, described hereinabove with reference to Fig. 7.

[0184] Reference is now made to Fig. 17 which is a simplified diagram illustrating a mode by which genes of a novel group of operon-like genes, described hereinabove with reference to Fig. 16 of the present invention, modulate expression of other such genes, in a cascading manner.GR1 GENE and GR2 GENE are two genes of the novel group of operon-like genes designated GR of Fig. 16. As is typical of genes of the GR group of genes, GR1 and GR2 each encode a long RNA precursor, which in turn folds into a folded RNA precursor comprising multiple hairpin shapes, and is cut into respective separate hairpin shaped RNA segments, each of which RNA segments being diced to yield a gene of a group of genes designated GAM of Fig. 8. In this manner GR1 yields GAM1 RNA, GAM2 RNA and GAM3 RNA, and GR2 yields GAM4 RNA, GAM5 RNA and GAM6 RNA.As Fig. 17 shows, GAM3 RNA , which de-

rives from GR1, binds a binding site located adjacent to GR2 GENE, thus modulating expression of GR2, thereby invoking expression of GAM4 RNA , GAM5 RNA and GAM6 RNA which derive from GR2.It is appreciated that the mode of modulation of expression presented by Fig. 17 enables an unlimited `cascading effect` in which a GR gene comprises multiple GAM genes, each of which may modulate expression of other GR genes, each such GR gene comprising additional GAM genes, etc., whereby eventually certain GAM genes modulate expression of target proteins. This mechanism is in accord with the conceptual model of the present invention addressing the differentiation enigma, described hereinabove with specific reference to Figs. 6 and 7.

[0185] Reference is now made to Fig. 18 which is a block diagram illustrating an overview of a methodology for finding novel genes and operon-like genes of the present invention, and their respective functions.According to a preferred embodiment of the present invention, the methodology to finding novel genes of the present invention and their function comprises of the following major steps:First, genes of the novel group of genes of the present invention, referred to here as GAM genes, are located and their

function elicited by detecting target proteins they bind and the function of those target proteins, as described hereinabove with reference to Figs. 9 through 15. Next, genes of a novel group of operon-like genes of the present invention, referred to here as GR genes, are located, by locating clusters of proximally located GAM genes, based on the previous step.Consequently, the hierarchy of GR and GAM genes is elicited: binding sites for non-protein-binding GAM genes comprised in each GR gene found are sought adjacent to other GR genes. When found, such a binding site indicates that the connection between the GAM and the GR the expression of which it modulates, and thus the hierarchy of the GR genes and the GAM genes they comprise.Lastly, the function of GR genes and GAM genes which are `high` in the hierarchy, i.e. GAM genes which modulate expression of other GR genes rather than directly modulating expression of target proteins, may be deduced. A preferred approach is as follows: The function of protein-modulating GAM genes is deducible from the proteins which they modulate, provided that the function of these target proteins is known. The function of `higher` GAM genes may be deduced by comparing the function of protein-modulating GAM

genes, with the hierarchical relationships by which the `higher` GAM genes are connected to the protein-modulating GAM genes. For example, given a group of several protein-modulating GAM genes, which collectively cause a protein expression pattern typical of a certain cell-type, then a `higher` GAM gene is sought which modulates expression of GR genes which perhaps modulate expression of other genes which eventually modulate expression of the given group of protein-modulating GAM genes. The `higher` GAM gene found in this manner is taken to be responsible for differentiation of that cell-type, as per the conceptual model of the invention described hereinabove with reference to Fig. 6.

[0186] Reference is now made to Fig. 19 which is a block diagram illustrating different utilities of genes of the novel group of genes of the present invention referred to here as GAM genes and GR genes.The present invention discloses a first plurality of novel genes referred to here as GAM genes, and a second plurality of operon-like genes referred to here as GR genes, each of the GR genes encoding a plurality of GAM genes. The present invention further discloses a very large number of known target-genes, which are bound by, and the expression of which is mod-

ulated by each of the novel genes of the present invention. Published scientific data referenced by the present invention provides specific, substantial, and credible evidence that the above mentioned target genes modulated by novel genes of the present invention, are associated with various diseases. Specific novel genes of the present invention, target genes thereof and diseases associated therewith, are described hereinbelow with reference to Tables 1 through 7. It is therefore appreciated that a function of GAM genes and GR genes of the present invention is modulation of expression of target genes related to known diseases, and that therefore utilities of novel genes of the present invention include diagnosis and treatment of the above mentioned diseases. Fig. 19 describes various types of diagnostic and therapeutic utilities of novel genes of the present invention.A utility of novel genes of the present invention is detection of GAM genes and of GR genes. It is appreciated that since GAM genes and GR genes modulate expression of disease related target genes, that detection of expression of GAM genes in clinical scenarios associated with said diseases is a specific, substantial and credible utility. Diagnosis of novel genes of the present invention may preferably be

implemented by RNA expression detection techniques, including but not limited to biochips, as is well known in the art. Diagnosis of expression of genes of the present invention may be useful for research purposes, in order to further understand the connection between the novel genes of the present invention and the above mentioned related diseases, for disease diagnosis and prevention purposes, and for monitoring disease progress.Another utility of novel genes of the present invention is anti-GAM gene therapy, a mode of therapy which allows up regulation of a disease related target-gene of a novel GAM gene of the present invention, by lowering levels of the novel GAM gene which naturally inhibits expression of that target gene. This mode of therapy is particularly useful with respect to target genes which have been shown to be under-expressed in association with a specific disease. Anti-GAM gene therapy is further discussed hereinbelow with reference to Figs. 20A and 20B.A further utility of novel genes of the present invention is GAM replacement therapy, a mode of therapy which achieves down regulation of a disease related target-gene of a novel GAM gene of the present invention, by raising levels of the GAM gene which naturally inhibits expression of that target gene. This

mode of therapy is particularly useful with respect to target genes which have been shown to be over-expressed in association with a specific disease. GAM replacement therapy involves introduction of supplementary GAM gene products into a cell, or stimulation of a cell to produce excess GAM gene products. GAM replacement therapy may preferably be achieved by transfecting cells with an artificial DNA molecule encoding a GAM gene, which causes the cells to produce the GAM gene product, as is well known in the art. Yet a further utility of novel genes of the present invention is modified GAM therapy. Disease conditions are likely to exist, in which a mutation in a binding site of a GAM gene prevents natural GAM gene to effectively bind inhibit a disease related target-gene, causing up regulation of that target gene, and thereby contributing to the disease pathology. In such conditions, a modified GAM gene is designed which effectively binds the mutated GAM binding site, i.e. is an effective anti-sense of the mutated GAM binding site, and is introduced in disease effected cells. Modified GAM therapy is preferably achieved by transfecting cells with an artificial DNA molecule encoding the modified GAM gene, which causes the cells to produce the modified GAM gene product, as is

well known in the art. An additional utility of novel genes of the present invention is induced cellular differentiation therapy. As aspect of the present invention is finding genes which determine cellular differentiation, as described hereinabove with reference to Fig. 18. Induced cellular differentiation therapy comprises transfection of cell with such GAM genes thereby determining their differentiation as desired. It is appreciated that this approach may be widely applicable, inter alia as a means for auto transplantation harvesting cells of one cell-type from a patient, modifying their differentiation as desired, and then transplanting them back into the patient. It is further appreciated that this approach may also be utilized to modify cell differentiation in vivo, by transfecting cells in a genetically diseased tissue with a cell-differentiation determining GAM gene, thus stimulating these cells to differentiate appropriately.

[0187] Reference is now made to Figs. 20A and 20B, simplified diagrams which when taken together illustrate anti-GAM gene therapy mentioned hereinabove with reference to Fig. 19. A utility of novel genes of the present invention is anti-GAM gene therapy, a mode of therapy which allows up regulation of a disease related target-gene of a novel

GAM gene of the present invention, by lowering levels of the novel GAM gene which naturally inhibits expression of that target gene. Fig. 20A shows a normal GAM gene, inhibiting translation of a target gene of GAM gene, by binding to a BINDING SITE found in an untranslated region of GAM TARGET RNA, as described hereinabove with reference to Fig. 8.

[0188] Fig. 20B shows an example of anti-GAM gene therapy. ANTI-GAM RNA is short artificial RNA molecule the sequence of which is an anti-sense of GAM RNA. Anti-GAM treatment comprises transfecting diseased cells with ANTI-GAM RNA, or with a DNA encoding thereof. The ANTI-GAM RNA binds the natural GAM RNA, thereby preventing binding of natural GAM RNA to its BINDING SITE. This prevents natural translation inhibition of GAM TARGET RNA by GAM RNA, thereby up regulating expression of GAM TARGET PROTEIN.

[0189] It is appreciated that anti-GAM gene therapy is particularly useful with respect to target genes which have been shown to be under-expressed in association with a specific disease. Furthermore, anti-GAM therapy is particularly useful, since it may be used in situations in which technologies known in the art as RNAi and siRNA can not

be utilized. As in known in the art, RNAi and siRNA are technologies which offer means for artificially inhibiting expression of a target protein, by artificially designed short RNA segments which bind complementarily to mRNA of said target protein. However, RNAi and siRNA can not be used to directly upregulate translation of target proteins.

[0190] Reference is now made to Fig. 21, which is a table summarizing laboratory validation results that validate efficacy of the bioinformatic gene detection engine 100 of Fig. 9. In order to assess efficacy of the bioinformatic gene detection engine 100, novel genes predicted thereby are preferably divided into 4 DETECTION ACCURACY GROUPS (first column), designated A through D, ranking GAMS from the most probable GAMs to the least probable GAMs, using the scores of HAIRPIN DETECTOR 114 and DICER-CUT LOCATION DETECTOR 116 as follows:

[0191] Group A: The score of the HAIRPIN-DETECTOR is above 0.7, the overall score of the two-phased predictor is above 0.55, and the score of the second phase of the two-phased predictor is above 0.75. Group B: The score of the EDIT-DISTANCE predictor is equal or above 17. In both groups A and B one miRNA is predicted for each

hairpin. Group C: The score of the HAIRPIN-DETECTOR is between 0.6 and 0.7, and the overall score of the two-phased predictor is above 0.55. Group D: The score of the HAIRPIN-DETECTOR is between 0.3 and 0.6, and the overall score of the two-phased predictor is above 0.55. In both groups C and D, for each hairpin both sides of the double stranded window are given as output, and are examined in the lab. The groups are mutually exclusive, i.e. in groups A, C and D all hairpins score less than 17 in the EDIT-DISTANCE predictor. It is appreciated that the division into groups is not exhaustive: 344 of the 440 published hairpins, and 4747 of the 8607 novel GAMs, detected bioinformatically by bioinformatic gene detection engine 100 of the present invention, belong to one of the groups.

[0192] Sample novel bioinformatically predicted genes, of each of these groups are sent to the laboratory for validation (third column), and the number (fourth column) and percent (fifth column) of successful validation of predicted genes is noted for each of the groups, as well as overall (bottom line). The number of novel genes explicitly specified by present invention belonging to each of the four groups is noted (sixth column), as is the number of novel

genes found in intergenic and intronic RNA (seventh and eighth columns). Expected positives (eighth column) is deduced by multiplying the % success in the lab validation by the number of novel GAMs detected in intronic and intergenic RNA databases.

[0193] It is appreciated that the bioinformatic gene detection engine 100 of the present invention detected 200 novel GAM genes, which fall into one of these four detection accuracy groups, and that the bioinformatic prediction is substantiated by a group of 50 novel GAM genes validated by laboratory means, out of 147 genes which were tested in the lab, resulting in validation of an overall 34% accuracy. The top group demonstrated 50% accuracy. Pictures of test-results of specific genes in the abovementioned four groups, as well as the methodology used for validating the expression of predicted genes is elaborated hereinbelow with reference to Fig. 22.

[0194] It is further appreciated that failure to detect a gene in the lab does not necessarily indicate a mistaken bioinformatic prediction. Rather, it may be due to technical sensitivity limitation of the lab test, or because the gene is not expressed in the tissue examined, or at the development phase tested.

[0195] It is still further appreciated that in general these findings are in agreement with the expected bioinformatic accuracy, as describe hereinabove with reference to Fig. 13B: assuming 80% accuracy of the hairpin detector 114 and 80% accuracy of the dicer-cut location detector 116 and 80% accuracy of the lab validation, this would result in 50% overall accuracy of the genes validated in the lab.

[0196] It is further appreciated that up to date, 71 novel GAMs detected by the bioinformatic gene detection engine 100, were confirmed by laboratory PCR-product Hybridization approach, as described hereinbelow with reference to Fig22. Furthermore, 22 novel GAMs out of the 71, were further confirmed by cloning and sequencing. Detailed references and laboratory pictures of sample of these GAMs is given in Fig22.

[0197] Reference is now made to Fig. 22 which is a picture of laboratory results validating the expression of 35 novel genes detected by the bioinformatic gene detection engine 100, in the four detection accuracy groups A through D described hereinabove with reference to Fig. 21.

[0198] Each row in Fig. 22, designated A through D, correlates to a corresponding one of the four detection accuracy groups A-D, described hereinabove with reference to Fig.

21. In each row, pictures of several genes validated by hybridization of PCR-product southern-blots, are provided, each corresponding to a specific GAM gene, as elaborated hereinbelow. These PCR-product hybridization pictures are designated 1 through 5 in the A group, 1 through 12 in the B group, 1 through 9 in the C group, and 1 through 4 in the D group. In each PCR hybridization picture, 2 lanes are seen: the test lane, designated "+" and the control lane, designated "-". For convenience of viewing the results, all PCR-product hybridization pictures of Fig. 22 have been shrunk x4 vertically. It is appreciated that for each of the tested genes, a clear hybridization band appears in the test ("+") lane, but not in the control ("-") lane.

[0199] Specifically, Fig 22 shows pictures of PCR-product hybridization validation by southern-blot, the methodology of which is described hereinbelow, to the following novel GAM genes:DETECTION ACCURACY GROUP A: (1) GAM8297; (2) GAM5346; (3) GAM281; (4) GAM8554; and (5)GAM2071. DETECTION ACCURACY GROUP B: (1) GAM7553; (2) GAM5385; (3) GAM5227; (4) GAM7809; (5) GAM1032; (6) GAM3431; (7) GAM7933; (8) GAM3298.;(9) GAM116; (10) GAM3418 (later published by other re-

searchers as MIR23); (11) GAM3499; (12) GAM3027; (13) GAM7080; (14) GAM895; and (15) GAM2608, (16) GAM20, and (17) GAM21.DETECTION ACCURACY GROUP C: (1) GAM3770; (2) GAM1338; (3) GAM7957; (4) GAM391; (5) GAM 8678; (6) GAM2033; (7)GAM7776; (8) GAM8145.1; and (9) GAM 633.DETECTION ACCURACY GROUP D: (1) GAM19; (2) GAM8358; (3) GAM3229; and (4) GAM7052.

[0200] In addition to the PCR detection, the following GAMs were confirmed by cloning and sequencing: GAM1338, GAM7809, GAM116, GAM3418 (later published by other researchers as MIR23), GAM3499, GAM3027, GAM7080, and GAM21.

[0201] The PCR-product hybridization validation methodology used is briefly described as follows. In order to validate the expression of predicted novel GAM genes, and assuming that these novel genes are probably expressed at low concentrations, a PCR product cloning approach was set up through the following strategy: two types of cDNA libraries designated "One tailed"and "Ligation"were prepared from frozen HeLa S100 extract (4c Biotech, Belgium) size fractionated RNA. Essentially, Total S100 RNA was prepared through an SDSProteinase K incubation followed by an acid Phenol-Chloroform purification and Iso-

propanol precipitation. Alternatively, total HeLa RNA was also used as starting material for these libraries.Fractionation was done by loading up to 500µg per YM100 Amicon Microcon column (Millipore) followed by a 500g centrifugation for 40 minutes at 4°C. Flowthrough "YM100"RNA consisting of about ¼ of the total RNA was used for library preparation or fractionated further by loading onto a YM30 Amicon Microcon column (Millipore) followed by a 13,500g centrifugation for 25 minutes at 4°C. Flowthrough "YM30" was used for library preparation as is and consists of less than 0.5% of total RNA. For the both the "ligation"and the "One-tailed"libraries RNA was dephosphorilated and ligated to an RNA (lowercase)-DNA (UPPERCASE) hybrid 5"-phosphorilated, 3" idT blocked 3"-adapter (5"-P-uuuAACCGCATTCTC-idT-3" Dharmacon # P-002045-01-05) (as elaborated in Elbashir et al 2001) resulting in ligation only of RNase III type cleavage products. 3"-Ligated RNA was excised and purified from a half 6%, half 13% polyacrylamide gel to remove excess adapter with a Nanosep 0.2µM centrifugal device (Pall) according to instructions, and precipitated with glycogen and 3 volumes of Ethanol. Pellet was resuspended in a minimal vol-

ume of water. For the "ligation"library a DNA (UPPERCASE)-RNA (lowercase) hybrid 5"-adapter (5"-TACTAATACGACTCACTaaa-3" Dharmacon # P-002046-01-05) was ligated to the 3"-adapted RNA, reverse transcribed with "EcoRI-RT": (5"-GACTAGCTGGAATTCAAGGATGCGGTTAAA-3"), PCR amplified with two external primers essentially as in Elbashir et al 2001 except that primers were "EcoRI-RT"and "PstI Fwd"(5"-CAGCCAACGCTGCAGATACGACTCACTAAA-3"). This PCR product was used as a template for a second round of PCR with one hemispecific and one external primer or with two hemispecific primers.

[0202] For the "One tailed"library the 3"-Adapted RNA was annealed to 20pmol primer "EcoRI RT"by heating to 70°C and cooling 0.1°C/sec to 30°C and then reverse transcribed with Superscript II RT (According to instructions, Invitrogen) in a 20µl volume for 10 alternating 5 minute cycles of 37°C and 45°C. Subsequently, RNA was digested with 1µl 2M NaOH, 2mM EDTA at 65°C for 10 minutes. cDNA was loaded on a polyacrylamide gel, excised and gel-purified from excess primer as above (invisible, judged by primer run alongside) and resuspended in 13µl

of water. Purified cDNA was then oligo-dC tailed with 400U of recombinant terminal transferase (Roche molecular biochemicals), 1µl 100µM dCTP, 1µl 15mM $CoCl_2$, and 4µl reaction buffer, to a final volume of 20µl for 15 minutes at 37°C. Reaction was stopped with 2µl 0.2M EDTA and 15µl 3M NaOAc pH 5.2. Volume was adjusted to 150µl with water, Phenol : Bromochloropropane 10:1 extracted and subsequently precipitated with glycogen and 3 volumes of Ethanol. C-tailed cDNA was used as a template for PCR with the external primers "T3-PstBsg(G/I)$_{18}$" (5"-AATTAACCCTCACTAAAGGCTGCAGGTGCAGGIGGGIIGGGIIGGGIIGN-3" where I stands for Inosine and N for any of the 4 possible deoxynucleotides), and with "EcoRI Nested"(5"-GGAATTCAAGGATGCGGTTA-3"). This PCR product was used as a template for a second round of PCR with one hemispecific and one external primer or with two hemispecific primers.Hemispecific primers were constructed for each predicted GAM by an in-house program designed to choose about half of the 5" or 3" sequence of the GAM corresponding to a TM°of about 30°-34°C constrained by an optimized 3" clamp, appended to the cloning adapter sequence (for "One-tailed"libraries 5"-GGNNGGGNNG on the 5" end of the GAM, or TTTAAC-

CGCATC-3" on the 3" end of the GAM. For "Ligation"libraries the same 3" adapter and 5"-CGACTCACTAAA on the 5" end). Consequently, a fully complementary primer of a TM°higher than 60°C was created covering only one half of the GAM sequence permitting the unbiased elucidation by sequencing of the other half.

[0203] CONFIRMATION OF GAM SEQUENCE AUTHENTICITY OF PCR PRODUCTS:SOUTHERN BLOT:PCR-product sequences were confirmed by southern blot (Southern EM. Biotechnology.1992; 24:122-39.(1975)) and hybridization with DNA oligonucleotide probes synthesized against predicted GAMs. Gels were transferred onto a Biodyne PLUS 0.45µm, (Pall) positively charged nylon membrane and UV cross-linked.Hybridization was performed overnight with DIG-labeled probes at 42^0C in DIG Easy-Hyb buffer (Roche). Membranes were washed twice with 2xSSC and 0.1% SDS for 10 min. at 42^0C and then washed twice with 0.5xSSC and 0.1% SDS for 5 min at 42^0C. The membrane was then developed by using a DIG luminescent detection kit (Roche) using anti-DIG and CSPD reaction, according to the manufacturer"s protocol. All probes were prepared according to the manufacturers (Roche Molecular Biochemi-

cals) protocols: Digoxigenin (DIG) labeled antisense transcripts was prepared from purified PCR products using a DIG RNA labeling kit with T3 RNA polymerase. DIG labeled PCR was prepared by using a DIG PCR labeling kit. 3"-DIG-tailed oligo ssDNA antisense probes, containing DIG-dUTP and dATP at an average tail length of 50 nucleotides were prepared from 100pmole oligonucleotides with the DIG Oligonucleotide Labeling Kit.

[0204] CLONING: PCR products were inserted into pGEM-T (Promega) or pTZ57 (MBI Fermentas), transformed into competent JM109 E. coli (Promega) and sown on LB-Amp plates with IPTG/Xgal. White and light-blue colonies were transferred to duplicate gridded plates, one of which was blotted onto a membrane (Biodyne Plus, Pall) for hybridization with DIG tailed oligo probes (according to instructions, Roche) corresponding to the expected GAM. Plasmid DNA from positive colonies was sequenced.

[0205] Reference is now made to Fig. 23A, which is a schematic representation of a novel human GR gene, herein designated GR12731 (RosettaGenomics Ltd. Gene Nomenclature), located on chromosome 9, comprising 2 known MIR genes - MIR24 and MIR23, and 2 novel GAM genes, herein designated GAM22 and GAM116, all marked by solid

black boxes. Fig. 23A also schematically illustrates 6 non-GAM hairpin sequences, and one non-hairpin sequence, all marked by white boxes, and serving as negative controls. By "non-GAM hairpin sequences" is meant sequences of a similar length to known MIR PRECURSOR sequences, which form hairpin secondary folding pattern similar to MIR PRECURSOR hairpins, and yet which are assessed by the bioinformatic gene detection engine 100 not to be valid GAM PRECURSOR hairpins. It is appreciated that Fig. 23A is a simplified schematic representation, reflecting only the order in which the segments of interest appear relative to one another, and not a proportional distance between the segments.

[0206] Reference is now made to Fig. 23B, which is a schematic representation of secondary folding of each of the MIRs and GAMs of GR GR12731 MIR24, MIR23, GAM22 and GAM116, and of the negative control non-GAM hairpins, herein designated N2, N3, N116, N4, N6 and N7. N0 is a non-hairpin control, of a similar length to that of known MIR PRECURSOR hairpins. It is appreciated that the negative controls are situated adjacent to and in between real MIR and GAM genes, and demonstrates similar secondary folding patterns to that of known MIRs and GAMs.

[0207] Reference is now made to Fig. 23C, which is a picture of laboratory results of a PCR test upon a YM100 "ligation"-library, utilizing specific primer sets directly inside the boundaries of the hairpins. Due to the nature of the library the only PCR amplifiable products can result from RNaseIII type enzyme cleaved RNA, as expected for legitimate hairpin precursors presumed to be produced by DROSHA (Lee et al, Nature 425 415-419, 2003). Fig 23C demonstrates expression of hairpin precursors of known MIR genes - MIR23 and MIR24, and of novel bioinformatically detected GAM22 and GAM116 genes predicted bioinformatically by a system constructed and operative in accordance with a preferred embodiment of the present invention. Fig. 23C also shows that none of the 7 controls (6 hairpins designated N2, N3, N23, N4, N6 and N7 and 1 non-hairpin sequence designated N0) were expressed. N116 is a negative control sequence partially overlapping GAM116.

[0208] In the picture, test lanes including template are designated "+" and the control lane is designated "-". It is appreciated that for each of the tested hairpins, a clear PCR band appears in the test ("+") lane, but not in the control ("-") lane.

[0209] Figs. 23A through 23C, when taken together validate the efficacy of the bioinformatic gene detection engine in: (a) detecting known MIR genes; (b) detecting novel GAM genes which are found adjacent to these MIR genes, and which despite exhaustive prior biological efforts and bioinformatic detection efforts, went undetected; (c) discerning between GAM (or MIR) PRECURSOR hairpins, and non-GAM hairpins.

[0210] It is appreciated that the ability to discern GAM-hairpins from non-GAM-hairpins is very significant in detecting GAM genes, since hairpins in general are highly abundant in the genome. Other MIR prediction programs have not been able to address this challenge successfully.

[0211] Reference is now made to Fig. 24A which is an annotated sequence of an EST comprising a novel gene detected by the gene detection system of the present invention. Fig. 24A shows the nucleotide sequence of a known human non-protein coding EST (Expressed Sequence Tag), identified as EST72223. The EST72223 clone obtained from TIGR database (Kirkness and Kerlavage, 1997) was sequenced to yield the above 705bp transcript with a polyadenyl tail. It is appreciated that the sequence of this EST comprises sequences of one known miRNA gene,

identified as MIR98, and of one novel GAM gene, referred to here as GAM25, detected by the bioinformatic gene detection system of the present invention and described hereinabove with reference to Fig. 9.

[0212] The sequences of the precursors of the known MIR98 and of the predicted GAM25 are in bold, the sequences of the established miRNA 98 and of the predicted miRNA GAM25 are underlined.

[0213] Reference is now made to Figs. 24B, 24C and 24D that are pictures of laboratory results, which when taken together demonstrate laboratory confirmation of expression of the bioinformatically detected novel gene of Fig. 24A. In two parallel experiments, an enzymatically synthesized capped, EST72223 RNA transcript, was incubated with Hela S100 lysate for 0 minutes, 4 hours and 24 hours. RNA was subsequently harvested, run on a denaturing polyacrylamide gel, and reacted with a 102nt and a 145nt antisense MIR98 and GAM25 precursor transcript probes respectively. The Northern blot results of these experiments demonstrated processing of EST72223 RNA by Hela lysate (lanes 2-4, in 24B and 24C), into ~80bp and ~22bp segments, which reacted with the MIR98 precursor probe (24B), and into ~100bp and ~24bp segments, which re-

acted with the GAM25 precursor probe (24C). These results demonstrate the processing of EST72223 by Hela lysate into MIR98 precursor and GAM25 precursor. It is also appreciated from Fig. 24C (lane 1) that Hela lysate itself reacted with the GAM25 precursor probe, in a number of bands, including a ~100bp band, indicating that GAM25-precursor is endogenously expressed in Hela cells. The presence of additional bands, higher than 100bp in lanes 5-9 probably corresponds to the presence of nucleotide sequences in Hela lysate, which contain the GAM25 sequence.

[0214] In addition, in order to demonstrate the kinetics and specificity of the processing of MIR98 and GAM25 miRNA precursors into their respective miRNA`s, transcripts of MIR98 and of the bioinformatically predicted GAM25, were similarly incubated with Hela S100 lysate, for 0 minutes, 30 minutes, 1 hour and 24 hours, and for 24 hours with the addition of EDTA, added to inhibit Dicer activity, following which RNA was harvested, run on a polyacrylamide gel and reacted with MIR98 and GAM25 precursor probes. Capped transcripts were prepared for in-vitro RNA cleavage assays with T7 RNA polymerase including a m ^{7}G(5')ppp(5')G-capping reaction the mMessage mMachine

kit (Ambion). Purified PCR products were used as template for the reaction. These were amplified for each assay with specific primers containing a T7 promoter at the 5" end and a T3 RNA polymerase promoter at the 3"end. Capped RNA transcripts were incubated at 30°C in supplemented, dialysis concentrated, Hela S100 cytoplasmic extract (4C Biotech, Seneffe, Belgium). The Hela S100 was supplemented by dialysis to a final concentration of 20mM Hepes, 100mM KCl, 2.5mM $MgCl_2$, 0.5mM DTT, 20% glycerol and protease inhibitor cocktail tablets (Complete mini Roche Molecular Biochemicals). After addition of all components, final concentrations were 100mM capped target RNA, 2mM ATP, 0.2mM GTP, 500U/ml RNasin, 25µg/ml creatine kinase, 25mM creatine phosphate, 2.5mM DTT and 50% S100 extract. Proteinase K, used to enhance Dicer activity (Zhang H, Kolb FA, Brondani V, Billy E, Filipowicz W. Human Dicer preferentially cleaves dsRNAs at their termini without a requirement for ATP.EMBO J. 2002 Nov 1;21(21):5875-85) was dissolved in 50mM Tris-HCl pH 8, 5mM $CaCl_2$, and 50% glycerol, was added to a final concentration of 0.6 mg/ml. Cleavage reactions were stopped by the addition of 8 volumes of proteinase K buffer (200Mm Tris-Hcl, pH 7.5, 25m M EDTA, 300mM

NaCl, and 2% SDS) and incubated at 65°C for 15min at different time points (0, 0.5, 1, 4, 24h) and subjected to phenol/chloroform extraction. Pellets were dissolved in water and kept frozen. Samples were analyzed on a segmented half 6%, half 13% polyacrylamide 1XTBE-7M Urea gel.

[0215] The Northern blot results of these experiments demonstrated an accumulation of a ~22bp segment which reacted with the MIR98 precursor probe, and of a ~24bp segment which reacted with the GAM25 precursor probe, over time (lanes 5-8). Absence of these segments when incubated with EDTA (lane 9), which is known to inhibit Dicer enzyme (Zhang et al., 2002), supports the notion that the processing of MIR98 and GAM25 miRNA`s from their precursors is mediated by Dicer enzyme, found in Hela lysate. The molecular sizes of EST72223, MIR-98 and GAM25 and their corresponding precursors are indicated by arrows.

[0216] Fig. 24D present Northern blot results of same above experiments with GAM25 probe (24nt). The results clearly demonstrated the accumulation of mature GAM25 gene after 24 h.

[0217] To validate the identity of the band shown by the lower

arrow in figs. 24C and 24D, a RNA band parallel to a marker of 24 base was excised from the gel and cloned as in Elbashir et al (2001) and sequenced. 90 clones corresponded to the sequence of mature GAM25 gene, three corresponded to GAM25* (the opposite arm of the hairpin with a 1-3 nucleotide 3" overhang) and two to the hairpin-loop.

[0218] GAM25 was also validated endogenously by sequencing from both sides from a HeLa YM100 total-RNA "ligation"libraries, utilizing hemispecific primers as detailed in Fig22.

[0219] Taken together, these results validate the presence and processing of a novel MIR gene product, GAM25, which was predicted bioinformatically. The processing of this novel gene product, by Hela lysate from EST72223, through its precursor, to its final form was similar to that observed for known gene, MIR98.

[0220] Transcript products were 705nt (EST72223), 102nt (MIR98 precursor), 125nt (GAM25 precursor) long. EST72223 was PCR amplified with T7-EST 72223 forward primer: 5"-TAATACGACTCACTATAGGCCCTTATTAGAGGATTCTGCT-3" and T3-EST72223 reverse primer:"-AATTAACCCTCACTAAAGGTTTTTTTTTCCTGAGA

CAGAGT-3".MIR98 was PCR amplified using EST72223 as a template with T7MIR98 forward primer: 5-"TAATACGACTCACTATAGGGTGAGGTAGTAAGTTGTATTGTT-3"and T3MIR98 reverse primer: 5"-AATTAACCCTCACTAAAGGGAAAGTAGTAAGTTGTATAGTT-3".GAM25 was PCR amplified using EST72223 as a template with GAM25 forward primer: 5"-GAGGCAGGAGAATTGCTTGA-3" and T3-EST72223 reverse primer:5"-AATTAACCCTCACTAAAGGCCTGAGACAGAGTCTTGCTC-3".

[0221] It is appreciated that the data presented in Figs. 24A, 24B,24C and 24D when taken together validate the function of the bioinformatic gene detection engine 100 of Fig. 9. Fig. 24A shows a novel GAM gene bioinformatically detected by the bioinformatic gene detection engine 100, and Figs. 24C and 24D show laboratory confirmation of the expression of this novel gene. This is in accord with the engine training and validation methodology described hereinabove with reference to Fig. 10.

[0222]

[0223] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 25 (GAM25), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[0224] GAM25 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM25 was detected is described hereinabove with reference to Figs. 8-15.

[0225] GAM25 gene, herein designated GAM GENE, and GAM25 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[0226] GAM25 gene encodes a GAM25 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM25 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM25 precursor RNA is designated SEQ ID:156, and is provided hereinbelow with reference to the sequence listing part.

[0227] GAM25 precursor RNA folds onto itself, forming GAM25 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0228] GAM25 precursor RNA folds onto itself, forming GAM25 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[0229] Nucleotide sequence of GAM25 precursor RNA, designated SEQ-ID: 156, and a schematic representation of a predicted secondary folding of GAM25 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[0230] An enzyme complex designated DICER COMPLEX, `dices` the GAM25 folded precursor RNA into GAM25 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM25 RNA is designated SEQ ID:206, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[0231] GAM25 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM25 target RNA, herein designated GAM TARGET RNA. GAM25 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0232] GAM25 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM25 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM25 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such

target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM25 RNA may have a different number of target binding sites in untranslated regions of a GAM25 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0233] The complementary binding of GAM25 RNA, herein designated GAM RNA, to target binding sites on GAM25 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM25 target RNA into GAM25 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[0234] It is appreciated that GAM25 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM25 target genes. The mRNA of each one of this plurality of GAM25 target genes comprises one or more target binding sites, each having a nucleotide sequence

which is at least partly complementary to GAM25 RNA, herein designated GAM RNA, and which when bound by GAM25 RNA causes inhibition of translation of respective one or more GAM25 target proteins.

[0235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM25 gene, herein designated GAM GENE, on one or more GAM25 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[0236] It is appreciated that specific functions and accordingly utilities of GAM25 correlate with, and may be deduced from, the identity of the target genes which GAM25 binds

and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0237]

[0238]

[0239] Alpha-1-b glycoprotein (A1BG, Accession NP_570602.2) is a GAM25 target gene, herein designated TARGET GENE. A1BG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by A1BG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE, designated SEQ ID:10249, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0240] A function of GAM25 is therefore inhibition of Alpha-1-b glycoprotein (A1BG, Accession NP_570602.2), a gene which a plasma protein of unknown function. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A1BG.

[0241] The function of A1BG has been established by previous studies. The complete amino acid sequence of alpha- 1B-

glycoprotein, a plasma protein of unknown function, was determined by Ishioka et al. (1986). Sequence homology to immunoglobulins was recognized. Alpha- 1B- glycoprotein is present in normal adult plasma at an average concentration of 22 mg/dl. Gahne et al. (1987) observed genetic polymorphism of A1B using one- dimensional horizontal polyacrylamide gel electrophoresis followed by Western blotting with specific antiserum. Three different phenotypes, designated 1- 1, 1- 2, and 2- 2, were observed. Family data supported the hypothesis that the three phenotypes are determined by 2 codominant alleles at an autosomal locus. In pigs the homologous locus is linked to malignant hyperthermia (OMIM Ref. No. 145600). Several other linkages in pigs and in horses suggest that human chromosomes 19, 6, and 1 are 'candidate chromosomes' for bearing the human A1B. Juneja et al. (1988) found a higher degree of A1B polymorphism in American blacks than in Caucasian populations. They described new alleles. Eiberg et al. (1989) reported exclusion data for localization of the alpha- 1B- glycoprotein gene polymorphism. Eiberg et al. (1989) found linkage between A1BG and Lutheran blood group (OMIM Ref. No. 111150); lod = 3.06 at theta = 0.05 in males, and lod = 1.42 at

theta = 0.10 in females. They suggested that the most likely order of genes on chromosome 19 is C3- - SE- - LU- - A1BG.

[0242]

[0243] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0244] Ishioka, N.; Takahashi, N.; Putnam, F. W. : Amino acid sequence of human plasma alpha- 1B- glycoprotein: homology to the immunoglobulin supergene family. Proc. Nat. Acad. Sci. 83: 2363- 2367, 1986. ; and

[0245] Eiberg, H.; Bisgaard, M. L.; Mohr, J. : Linkage between alpha- 1- B- glycoprotein (A1BG) and Lutheran (LU) red blood group system: assignment to chromosome 19: new genetic variants of A1BG.

[0246] Further studies establishing the function and utilities of A1BG are found in John Hopkins OMIM database record ID 138670, and in cited publications listed in Table 5, which are hereby incorporated by reference.Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NP_001600.1) is another GAM25 target gene, herein designated TARGET GENE. ACADSB BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by ACADSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:2370, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0247] Another function of GAM25 is therefore inhibition of Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NP_001600.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB.

[0248] A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 4 (ADAMTS4, Accession NP_005090.1) is another GAM25 target gene, herein designated TARGET GENE. ADAMTS4 BINDING SITE1 and ADAMTS4 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ADAMTS4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS4 BINDING SITE1 and ADAMTS4 BINDING SITE2, designated SEQ ID:12986 and SEQ ID:7708 respectively, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0249] Another function of GAM25 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 4 (ADAMTS4, Accession NP_005090.1), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS4.

[0250] The function of ADAMTS4 has been established by previous studies. Aggrecan degradation is an important factor in the erosion of articular cartilage in arthritic diseases. This degradation involves proteolysis of the aggrecan core protein near the N terminus, where 2 major cleavage sites have been identified. Matrix metalloproteinases (MMPs) cleave aggrecan between asn341 and phe342. Aggrecanase cleaves aggrecan between glu373 and ala374. Tortorella et al. (1999) purified and partially sequenced bovine aggrecanase- 1. By PCR with primers designed from a highly homologous murine EST, they cloned sequences from the homologous human cDNA. They assembled a full- length open reading frame from this initial

human PCR product and from another human EST. The human aggrecanase- 1 (ADAMTS4) open reading frame encodes an 837- amino acid protein with a signal sequence, a propeptide domain, a catalytic domain, a disintegrin- like domain, and a C- terminal domain with a thrombospondin (TSP) type 1 motif. There is a conserved zinc- binding domain and a furin- sensitive sequence. The presence of a probable cysteine switch sequence in aggrecanase- 1 suggested that, like the MMPs, it is synthesized as a zymogen and is cleaved to remove the propeptide domain and generate the mature active enzyme. A cloned portion of the bovine aggrecanase- 1 cDNA was 94% homologous to the human cDNA. Human aggrecanase- 1 cleaved bovine aggrecan between the glu373- ala374, but not the asn341- phe342, bond. Tortorella et al. (1999) stated that ADAMTS4 mRNA is present in brain, lung, and heart, and at very low levels in placenta and muscle tissues. By RT- PCR, Tortorella et al. (1999) observed upregulation of the aggrecanase- 1 message in stimulated human fetal chondrocytes and in joint tissues from adjuvant arthritic rats. Using a GeneBridge 4 radiation hybrid panel, Ishikawa et al. (1998) mapped the ADAMTS4 gene to chromosome 1. Hurskainen et al.

(1999) mapped the human ADAMTS4 gene to chromosome 1 by somatic cell hybrid analysis. They mapped the mouse Adamts4 gene to chromosome 1.

[0251]

[0252] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0253] Tortorella, M. D.; Burn, T. C.; Pratta, M. A.; Abbaszade, I.; Hollis, J. M.; Liu, R.; Rosenfeld, S. A.; Copeland, R. A.; Decicco, C. P.; Wynn, R.; Rockwell, A.; Yang, F.; and 16 others : Purification and cloning of aggrecanase- 1: a member of the ADAMTS family of proteins. Science 284: 1664-1666, 1999. ; and

[0254] Hurskainen, T. L.; Hirohata, S.; Seldin, M. F.; Apte, S. S. : ADAM- TS5, ADAM- TS6, and ADAM- TS7, novel members of a new family of zinc metalloproteases: general features and genomic dist.

[0255] Further studies establishing the function and utilities of ADAMTS4 are found in John Hopkins OMIM database record ID 603876, and in cited publications listed in Table 5, which are hereby incorporated by reference.Aryl hydrocarbon receptor (AHR, Accession NP_001612.1) is another GAM25 target gene, herein designated TARGET GENE. AHR

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AHR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:13044, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0256] Another function of GAM25 is therefore inhibition of Aryl hydrocarbon receptor (AHR, Accession NP_001612.1), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic- metabolizing enzymes and therefore may be associated with Stomach tumors. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Stomach tumors, and of other diseases and clinical conditions associated with AHR.

[0257] The function of AHR has been established by previous studies. Halogenated aromatic hydrocarbons, represented by 2,3,7,8- tetrachlorodibenzo- p- dioxin (TCDD), are environmental pollutants that are produced by minor side- reactions in chemical manufacturing processes and by combustion of waste materials. These chemicals cause potent and pleiotropic toxicity, including teratogenesis,

immune suppression, epithelial disorders, and tumor production in experimental animals. At the molecular level, aldehyde dehydrogenase, quinone reductase, and various drug- metabolizing enzymes are induced by the chemicals in some cultured cells and some tissues of experimental animals. All these biologic effects are thought to be mediated by an intracellular aryl hydrocarbon receptor (AHR). By fluorescence in situ hybridization and by DNA blot hybridization using human/mouse or human/Chinese hamster hybrid cell DNAs, Ema et al. (1994) assigned the AHR gene to 7p21. By use of PCR analysis of somatic cell hybrids and fluorescence in situ hybridization of metaphase cells, Le Beau et al. (1994) localized the AHR gene to 7p21- p15. Micka et al. (1997) localized the AHR gene to 7p15 using fluorescence in situ hybridization. Performing linkage analysis in a 3- generation family, they showed with good probability that the high CYP1A1 (OMIM Ref. No. 108330) inducibility phenotype segregates with the 7p15 region.

[0258] Animal model experiments lend further support to the function of AHR. To determine whether the aryl hydrocarbon receptor plays a role in modulating carcinogenesis through the induction of xenobiotic- metabolizing en-

zymes, Shimizu et al. (2000) studied Ahr- deficient mice exposed to benzo(a)pyrene, a widely distributed environmental carcinogen.

[0259] It is appreciated that the abovementioned animal model for AHR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0260] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0261] Ema, M.; Matsushita, N.; Sogawa, K.; Ariyama, T.; Inazawa, J.; Nemoto, T.; Ota, M.; Oshimura, M.; Fujii- Kuriyama, Y. : Human arylhydrocarbon receptor: functional expression and chromosomal assignment to 7p21. J. Biochem. 116: 845- 851, 1994. ; and

[0262] Shimizu, Y.; Nakatsuru, Y.; Ichinose, M.; Takahashi, Y.; Kume, H.; Mimura, J.; Fujii- Kuriyama, Y.; Ishikawa, T. : Benzo[a]pyrene carcinogenicity is lost in mice lacking the aryl hydrocar.

[0263] Further studies establishing the function and utilities of AHR are found in John Hopkins OMIM database record ID 600253, and in cited publications listed in Table 5, which are hereby incorporated by reference.AP1S3 (Accession

XP_291023.1) is another GAM25 target gene, herein designated TARGET GENE. AP1S3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1S3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1S3 BINDING SITE, designated SEQ ID:16221, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0264] Another function of GAM25 is therefore inhibition of AP1S3 (Accession XP_291023.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S3.

[0265] Apoptotic protease activating factor (APAF1, Accession NP_001151.1) is another GAM25 target gene, herein designated TARGET GENE. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by APAF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1

BINDING SITE2, designated SEQ ID:8675 and SEQ ID:8675 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0266] Another function of GAM25 is therefore inhibition of Apoptotic protease activating factor (APAF1, Accession NP_001151.1), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3 and therefore may be associated with Cancer. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with APAF1.

[0267] The function of APAF1 has been established by previous studies. Metastatic melanoma is a deadly cancer that fails to respond to conventional chemotherapy. Mutations in p53 (OMIM Ref. No. 191170) often occur in aggressive and chemoresistant cancers but are rarely observed in melanoma. Soengas et al. (2001) showed that metastatic melanomas often lose APAF1. Loss of APAF1 expression was accompanied by allelic loss in metastatic melanomas, but could be recovered in melanoma cell lines by treatment with the methylation inhibitor 5- aza- 2- prime- deoxycytidine (5aza2dC). APAF1- negative melanomas were invariably chemoresistant and were unable to exe-

cute a typical apoptotic program in response to p53 activation. Restoring physiologic levels of APAF1 through gene transfer or 5aza2dC treatment markedly enhanced chemosensitivity and rescued the apoptotic defects associated with APAF1 loss. Soengas et al. (2001) concluded that APAF1 is inactivated in metastatic melanomas, leading to defects in the execution of apoptotic cell death.

[0268] Animal model experiments lend further support to the function of APAF1. Yoshida et al. (1998) also produced Apaf1- deficient mice which exhibited reduced apoptosis in the brain and striking craniofacial abnormalities with hyperproliferation of neuronal cells. Apaf1- deficient cells were resistant to a variety of apoptotic stimuli, and the processing of caspases- 2, - 3, and - 8 was impaired. However, both Apaf1 - /- thymocytes and activated T lymphocytes were sensitive to Fas- induced killing, showing that Fas- mediated apoptosis in these cells is independent of Apaf1. These data indicated that Apaf1 plays a central role in the common events of mitochondria- dependent apoptosis in most death pathways and that this role is critical for normal development.

[0269] It is appreciated that the abovementioned animal model for APAF1 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0270] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0271] Soengas, M. S.; Capodieci, P.; Polsky, D.; Mora, J.; Esteller, M.; Opitz- Araya, X.; McCombie, R.; Herman, J. G.; Gerald, W. L.; Lazebnik, Y. A.; Cordon- Cardo, C.; Lowe, S. W. : Inactivation of the apoptosis effector Apaf- 1 in malignant melanoma. Nature 409: 207- 211, 2001. ; and

[0272] Yoshida, H.; Kong, Y.- Y.; Yoshida, R.; Elia, A. J.; Hakem, A.; Hakem, R.; Penninger, J. M.; Mak, T. W. : Apaf1 is required for mitochondrial pathways of apoptosis and brain development.

[0273] Further studies establishing the function and utilities of APAF1 are found in John Hopkins OMIM database record ID 602233, and in cited publications listed in Table 5, which are hereby incorporated by reference.Apoptotic protease activating factor (APAF1, Accession NP_001151.1) is another GAM25 target gene, herein designated TARGET GENE. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by

APAF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:9041 and SEQ ID:9041 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0274] Another function of GAM25 is therefore inhibition of Apoptotic protease activating factor (APAF1, Accession NP_001151.1), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3 and therefore may be associated with Cancer. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with APAF1.

[0275] The function of APAF1 has been established by previous studies. Metastatic melanoma is a deadly cancer that fails to respond to conventional chemotherapy. Mutations in p53 (OMIM Ref. No. 191170) often occur in aggressive and chemoresistant cancers but are rarely observed in melanoma. Soengas et al. (2001) showed that metastatic melanomas often lose APAF1. Loss of APAF1 expression was accompanied by allelic loss in metastatic melanomas,

but could be recovered in melanoma cell lines by treatment with the methylation inhibitor 5- aza- 2- prime- deoxycytidine (5aza2dC). APAF1- negative melanomas were invariably chemoresistant and were unable to execute a typical apoptotic program in response to p53 activation. Restoring physiologic levels of APAF1 through gene transfer or 5aza2dC treatment markedly enhanced chemosensitivity and rescued the apoptotic defects associated with APAF1 loss. Soengas et al. (2001) concluded that APAF1 is inactivated in metastatic melanomas, leading to defects in the execution of apoptotic cell death.

[0276] Animal model experiments lend further support to the function of APAF1. Yoshida et al. (1998) also produced Apaf1- deficient mice which exhibited reduced apoptosis in the brain and striking craniofacial abnormalities with hyperproliferation of neuronal cells. Apaf1- deficient cells were resistant to a variety of apoptotic stimuli, and the processing of caspases- 2, - 3, and - 8 was impaired. However, both Apaf1 - /- thymocytes and activated T lymphocytes were sensitive to Fas- induced killing, showing that Fas- mediated apoptosis in these cells is independent of Apaf1. These data indicated that Apaf1 plays a central role in the common events of mitochondria- de-

pendent apoptosis in most death pathways and that this role is critical for normal development.

[0277] It is appreciated that the abovementioned animal model for APAF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0278] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0279] Soengas, M. S.; Capodieci, P.; Polsky, D.; Mora, J.; Esteller, M.; Opitz- Araya, X.; McCombie, R.; Herman, J. G.; Gerald, W. L.; Lazebnik, Y. A.; Cordon- Cardo, C.; Lowe, S. W. : Inactivation of the apoptosis effector Apaf- 1 in malignant melanoma. Nature 409: 207- 211, 2001. ; and

[0280] Yoshida, H.; Kong, Y.- Y.; Yoshida, R.; Elia, A. J.; Hakem, A.; Hakem, R.; Penninger, J. M.; Mak, T. W. : Apaf1 is required for mitochondrial pathways of apoptosis and brain development.

[0281] Further studies establishing the function and utilities of APAF1 are found in John Hopkins OMIM database record ID 602233, and in cited publications listed in Table 5, which are hereby incorporated by reference.APM1 (Accession NP_004788.1) is another GAM25 target gene,

herein designated TARGET GENE. APM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:10422, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0282] Another function of GAM25 is therefore inhibition of APM1 (Accession NP_004788.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[0283] Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3f (APOBEC3F, Accession NP_660341.2) is another GAM25 target gene, herein designated TARGET GENE. APOBEC3F BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APOBEC3F, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOBEC3F BINDING SITE, designated SEQ ID:11252, to the nucleotide sequence of GAM25 RNA,

herein designated GAM RNA, also designated SEQ ID:206.

[0284] Another function of GAM25 is therefore inhibition of Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3f (APOBEC3F, Accession NP_660341.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOBEC3F.

[0285] Aquaporin 6, kidney specific (AQP6, Accession NP_001643.1) is another GAM25 target gene, herein designated TARGET GENE. AQP6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AQP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:6016, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0286] Another function of GAM25 is therefore inhibition of Aquaporin 6, kidney specific (AQP6, Accession NP_001643.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6.

[0287] The function of AQP6 has been established by previous studies. Ma et al. (1997), who referred to this gene as aquaporin- 6 (AQP6), demonstrated that, among the 7 human aquaporins cloned to that time (AQPs 0 to 6), the genes encoding the 4 most closely related aquaporins all mapped to 12q13: AQP0, AQP2, AQP5 (OMIM Ref. No. 600442), and AQP6. To construct a physical map and identify novel aquaporin gene members of this cluster, Ma et al. (1997) screened a human CEPH B YAC library by PCR using primers derived from exon 4 of the AQP2 and AQP0 genes. A YAC clone with 200 kb of human DNA was isolated an analyzed. Primary pulsed field gel electrophoresis and Southern blot analysis indicated the presence of AQP2, AQP5, and AQP6 genes, but not AQP0. Restriction mapping and PCR analysis yielded a precise physical map in which the 3 aquaporin genes spanned only approximately 27 kb with the order, transcription orientation, and spacer length as follows: 5- prime- - AQP2- - 5kb spacer- - AQP5- - 7kb spacer- - AQP6- - 3- prime. Yasui et al. (1999) showed that AQP6 is localized exclusively in

intracellular membranes in renal epithelia. Sequential ultracentrifugation of rat kidney homogenates confirmed that AQP6 resides predominantly in vesicular fractions, and immunohistochemical and immunoelectron microscopic studies confirmed that more than 98% of AQP6 is located in intracellular membrane vesicles. In glomeruli, AQP6 is present in membrane vesicles within podocyte cell bodies and foot processes. In proximal tubules, AQP6 is also abundant in membrane vesicles within the subapical compartment of segment 2 and segment 3 cells, but was not detected in the brush border or basolateral membranes. In collecting duct, AQP6 resides in intracellular membrane vesicles in apical, mid, and basolateral cytoplasm of type A intercalated cells, but was not observed in the plasma membrane. Unlike other members of the AQP family, the unique distribution in intracellular membrane vesicles in multiple types of renal epithelia indicated that AQP6 is not simply involved in transcellular fluid absorption. These studies predicted that AQP6 participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism.

[0288]

[0289] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[0290] Ma, T.; Yang, B.; Umenishi, F.; Verkman, A. S. : Closely spaced tandem arrangement of AQP2, AQP5, and AQP6 genes in a 27- kilobase segment at chromosome locus 12q13. Genomics 43: 387- 389, 1997. ; and

[0291] Yasui, M.; Kwon, T.- H.; Knepper, M. A.; Nielsen, S.; Agre, P. : Aquaporin- 6: an intracellular vesicle water channel protein in renal epithelia. Proc. Nat. Acad. Sci. 96: 5808- 5813, 1999.

[0292] Further studies establishing the function and utilities of AQP6 are found in John Hopkins OMIM database record ID 601383, and in cited publications listed in Table 5, which are hereby incorporated by reference.Aquaporin 6, kidney specific (AQP6, Accession NP_445738.1) is another GAM25 target gene, herein designated TARGET GENE. AQP6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AQP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:6016, to the nucleotide sequence of GAM25 RNA,

herein designated GAM RNA, also designated SEQ ID:206.

[0293] Another function of GAM25 is therefore inhibition of Aquaporin 6, kidney specific (AQP6, Accession NP_445738.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6.

[0294] The function of AQP6 has been established by previous studies. Ma et al. (1997), who referred to this gene as aquaporin- 6 (AQP6), demonstrated that, among the 7 human aquaporins cloned to that time (AQPs 0 to 6), the genes encoding the 4 most closely related aquaporins all mapped to 12q13: AQP0, AQP2, AQP5 (OMIM Ref. No. 600442), and AQP6. To construct a physical map and identify novel aquaporin gene members of this cluster, Ma et al. (1997) screened a human CEPH B YAC library by PCR using primers derived from exon 4 of the AQP2 and AQP0 genes. A YAC clone with 200 kb of human DNA was isolated an analyzed. Primary pulsed field gel electrophoresis and Southern blot analysis indicated the presence of AQP2, AQP5, and AQP6 genes, but not AQP0. Restriction

mapping and PCR analysis yielded a precise physical map in which the 3 aquaporin genes spanned only approximately 27 kb with the order, transcription orientation, and spacer length as follows: 5- prime- - AQP2- - 5kb spacer- - AQP5- - 7kb spacer- - AQP6- - 3- prime. Yasui et al. (1999) showed that AQP6 is localized exclusively in intracellular membranes in renal epithelia. Sequential ultracentrifugation of rat kidney homogenates confirmed that AQP6 resides predominantly in vesicular fractions, and immunohistochemical and immunoelectron microscopic studies confirmed that more than 98% of AQP6 is located in intracellular membrane vesicles. In glomeruli, AQP6 is present in membrane vesicles within podocyte cell bodies and foot processes. In proximal tubules, AQP6 is also abundant in membrane vesicles within the subapical compartment of segment 2 and segment 3 cells, but was not detected in the brush border or basolateral membranes. In collecting duct, AQP6 resides in intracellular membrane vesicles in apical, mid, and basolateral cytoplasm of type A intercalated cells, but was not observed in the plasma membrane. Unlike other members of the AQP family, the unique distribution in intracellular membrane vesicles in multiple types of renal epithelia indicated that

AQP6 is not simply involved in transcellular fluid absorption. These studies predicted that AQP6 participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism.

[0295]

[0296] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0297] Ma, T.; Yang, B.; Umenishi, F.; Verkman, A. S. : Closely spaced tandem arrangement of AQP2, AQP5, and AQP6 genes in a 27- kilobase segment at chromosome locus 12q13. Genomics 43: 387- 389, 1997. ; and

[0298] Yasui, M.; Kwon, T.- H.; Knepper, M. A.; Nielsen, S.; Agre, P. : Aquaporin- 6: an intracellular vesicle water channel protein in renal epithelia. Proc. Nat. Acad. Sci. 96: 5808- 5813, 1999.

[0299] Further studies establishing the function and utilities of AQP6 are found in John Hopkins OMIM database record ID 601383, and in cited publications listed in Table 5, which are hereby incorporated by reference.Archain 1 (ARCN1, Accession NP_001646.2) is another GAM25 target gene, herein designated TARGET GENE. ARCN1 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by ARCN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:17729, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0300] Another function of GAM25 is therefore inhibition of Ar-chain 1 (ARCN1, Accession NP_001646.2), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1.

[0301] The function of ARCN1 has been established by previous studies. Radice et al. (1995) identified a gene that maps approximately 50- kb telomeric to MLL (OMIM Ref. No. 159555) in band 11q23.3, a locus disrupted in certain leukemia- associated translocation chromosomes. A 200-kb genomic fragment from a YAC that includes MLL was used to screen a cDNA library of the R54;11 cell line which carries a translocation chromosome t(4;11)(q21; q23). The cDNA sequence predicts a 511- amino acid protein which shares similarity with predicted proteins of unknown

function from rice (Oryza sativa) and Drosophila. Because of this ancient conservation the authors proposed the name archain (ARCN1). Radice et al. (1995) detected 4- kb ARCN1 transcripts by Northern blot analysis in all tissues examined. The protein encoded by the ARCN1 gene, the coatomer protein delta- COP, probably plays a fundamental role in eukaryotic cell biology. Tunnacliffe at al. (1996)demonstrated that it is conserved across diverse eukaryotes. Very close or identical matches were seen in rat and cow; highly significant matches were seen with 2 plant species, A. thaliana (cress) and S. tuberosum (OMIM Ref. No. potato). Of particular biologic significance was the match with a sequence on yeast chromosome VI, from which Tunnacliffe et al. (1996) were able to determine the yeast archain gene and protein sequence. Unpublished data indicated that in situ hybridizations on mouse embryo sections showed archain transcripts throughout the whole animal.

[0302]

[0303] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0304] Radice, P.; Pensotti, V.; Jones, C.; Perry, H.; Pierotti, M. A.;

Tunnacliffe, A. : The human archain gene, ARCN1, has highly conserved homologs in rice and Drosophila. Genomics 26: 101- 106, 1995. ; and

[0305] Tunnacliffe, A.; van de Vrugt, H.; Pensotti, V.; Radice, P. : The coatomer protein delta- COP, encoded by the archain gene, is conserved across diverse eukaryotes. Mammalian Genome 7: 78.

[0306] Further studies establishing the function and utilities of ARCN1 are found in John Hopkins OMIM database record ID 600820, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ras homolog gene family, member f (in filopodia) (ARHF, Accession NP_061907.1) is another GAM25 target gene, herein designated TARGET GENE. ARHF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHF BINDING SITE, designated SEQ ID:8788, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0307] Another function of GAM25 is therefore inhibition of Ras homolog gene family, member f (in filopodia) (ARHF, Ac-

cession NP_061907.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHF.

[0308] Rho gtpase activating protein 1 (ARHGAP1, Accession NP_004299.1) is another GAM25 target gene, herein designated TARGET GENE. ARHGAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGAP1 BINDING SITE, designated SEQ ID:13340, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0309] Another function of GAM25 is therefore inhibition of Rho gtpase activating protein 1 (ARHGAP1, Accession NP_004299.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP1.

[0310] ARPP-19 (Accession NP_006619.1) is another GAM25 target gene, herein designated TARGET GENE. ARPP-19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARPP-19, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:15452, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0311] Another function of GAM25 is therefore inhibition of ARPP-19 (Accession NP_006619.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19.

[0312] ART5 (Accession NP_443750.2) is another GAM25 target gene, herein designated TARGET GENE. ART5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ART5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ART5 BINDING SITE, designated SEQ ID:5997, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0313] Another function of GAM25 is therefore inhibition of ART5 (Accession NP_443750.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ART5.

[0314] Ankyrin repeat and socs box-containing 16 (ASB16, Accession NP_543139.4) is another GAM25 target gene, herein designated TARGET GENE. ASB16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASB16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:7753, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0315] Another function of GAM25 is therefore inhibition of Ankyrin repeat and socs box-containing 16 (ASB16, Accession NP_543139.4) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16.

[0316] ASE-1 (Accession NP_036231.1) is another GAM25 target gene, herein designated TARGET GENE. ASE-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASE-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of ASE-1 BINDING SITE, designated SEQ ID:17464, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0317] Another function of GAM25 is therefore inhibition of ASE-1 (Accession NP_036231.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASE-1.

[0318] ATF7IP2 (Accession NP_079273.1) is another GAM25 target gene, herein designated TARGET GENE. ATF7IP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATF7IP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATF7IP2 BINDING SITE, designated SEQ ID:17594, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0319] Another function of GAM25 is therefore inhibition of ATF7IP2 (Accession NP_079273.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF7IP2.

[0320] Atpase, na+/k+ transporting, beta 2 polypeptide

(ATP1B2, Accession NP_001669.1) is another GAM25 target gene, herein designated TARGET GENE. ATP1B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:9693, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0321] Another function of GAM25 is therefore inhibition of Atpase, na+/k+ transporting, beta 2 polypeptide (ATP1B2, Accession NP_001669.1), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na +/K+ ions across the plasma membrane. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2.

[0322] The function of ATP1B2 has been established by previous studies. In the mouse, Malo et al. (1990) mapped the beta- 2 subunit of sodium- potassium- ATPase to chromosome 11 in a segment that is conserved on the pericentromeric region of human chromosome 17. Thus, Malo et al. (1990) speculated that the human ATP1B2 gene is

on the proximal short arm or pericentric area of chromosome 17. By somatic cell hybrid analysis, Hsieh et al. (1990) demonstrated that the gene is indeed located on human chromosome 17 and confirmed the assignment to mouse chromosome 11, They referred to the gene as AMOG (adhesion molecule on glia). The adhesion molecule on glia is an integral membrane glycoprotein of MW 45- 50 K that is expressed by glial cells and mediates granule neuron migration along Bergmann glial cells in the developing cerebellum. The cDNA sequence of the mouse gene (Pagliusi et al., 1989) shows structural similarity to the beta subunit of Na,K- ATPase (ATP1B1; 182330). This enzyme consists of 2 subunits: a catalytic alpha subunit and a beta subunit of unknown function. Like ATP1B1, AMOG is molecularly associated with the alpha subunit and influences its catalytic activity. AMOG may be the same as what is referred to here as ATP1B2. Another beta- isoform gene expressed primarily in brain was isolated by Martin- Vasallo et al. (1989); its sequence is 97% identical to that for AMOG (Gloor et al., 1990). By study of recombinant inbred strains, Hsieh et al. (1990) placed the Amog locus close to the genes for zinc finger protein- 3 (OMIM Ref. No. 194480) and the asialoglyco-

protein receptor (108360, 108361) in a region of mouse chromosome 11 that is homologous to human 17p.

[0323]

[0324] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0325] Gloor, S.; Antonicek, H.; Sweadner, K. J.; Pagliusi, S.; Frank, R.; Moos, M.; Schachner, M. : The adhesion molecule on glia (AMOG) is a homologue of the beta subunit of the Na,K- ATPase. J. Cell Biol. 110: 165- 174, 1990. ; and

[0326] Martin- Vasallo, P.; Dackowski, P.; Emanuel, J. R.; Levenson, R. : Identification of a putative isoform of the Na,K-ATPase beta subunit: primary structure and tissue- specific expression.

[0327] Further studies establishing the function and utilities of ATP1B2 are found in John Hopkins OMIM database record ID 182331, and in cited publications listed in Table 5, which are hereby incorporated by reference.ATP6V1A (Accession NP_001681.2) is another GAM25 target gene, herein designated TARGET GENE. ATP6V1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP6V1A, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V1A BINDING SITE, designated SEQ ID:12374, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0328] Another function of GAM25 is therefore inhibition of ATP6V1A (Accession NP_001681.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1A.

[0329] Atpase, class i, type 8b, member 2 (ATP8B2, Accession XP_290875.1) is another GAM25 target gene, herein designated TARGET GENE. ATP8B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP8B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:4561, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0330] Another function of GAM25 is therefore inhibition of Atpase, class i, type 8b, member 2 (ATP8B2, Accession

XP_290875.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2.

[0331] Udp-gal:betaglcnac beta 1,3-galactosyltransferase, polypeptide 3 (B3GALT3, Accession NP_003772.1) is another GAM25 target gene, herein designated TARGET GENE. B3GALT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by B3GALT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B3GALT3 BINDING SITE, designated SEQ ID:20124, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0332] Another function of GAM25 is therefore inhibition of Udp-gal:betaglcnac beta 1,3-galactosyltransferase, polypeptide 3 (B3GALT3, Accession NP_003772.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT3.

[0333] Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 5 (B4GALT5, Accession NP_004767.1) is an-

other GAM25 target gene, herein designated TARGET GENE. B4GALT5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B4GALT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:15509, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0334] Another function of GAM25 is therefore inhibition of Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 5 (B4GALT5, Accession NP_004767.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5.

[0335] Bcl2-associated athanogene 5 (BAG5, Accession NP_004864.1) is another GAM25 target gene, herein designated TARGET GENE. BAG5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAG5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated

SEQ ID:14301, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0336] Another function of GAM25 is therefore inhibition of Bcl2-associated athanogene 5 (BAG5, Accession NP_004864.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5.

[0337] BHD (Accession NP_659434.2) is another GAM25 target gene, herein designated TARGET GENE. BHD BINDING SITE1 and BHD BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BHD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BHD BINDING SITE1 and BHD BINDING SITE2, designated SEQ ID:11559 and SEQ ID:19921 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0338] Another function of GAM25 is therefore inhibition of BHD (Accession NP_659434.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHD.

[0339] Bcl2/adenovirus e1b 19kda interacting protein 2 (BNIP2, Accession NP_004321.1) is another GAM25 target gene, herein designated TARGET GENE. BNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BNIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BNIP2 BINDING SITE, designated SEQ ID:20177, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0340] Another function of GAM25 is therefore inhibition of Bcl2/adenovirus e1b 19kda interacting protein 2 (BNIP2, Accession NP_004321.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP2.

[0341] BRIP1 (Accession NP_114432.1) is another GAM25 target gene, herein designated TARGET GENE. BRIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BRIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRIP1 BIND-

ING SITE, designated SEQ ID:11243, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0342] Another function of GAM25 is therefore inhibition of BRIP1 (Accession NP_114432.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRIP1.

[0343] Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession NP_008979.2) is another GAM25 target gene, herein designated TARGET GENE. BTN3A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BTN3A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:17690, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0344] Another function of GAM25 is therefore inhibition of Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession NP_008979.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1.

[0345] C14orf53 (Accession XP_058620.2) is another GAM25 target gene, herein designated TARGET GENE. C14orf53 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf53, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf53 BINDING SITE, designated SEQ ID:16501, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0346] Another function of GAM25 is therefore inhibition of C14orf53 (Accession XP_058620.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf53.

[0347] Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) is another GAM25 target gene, herein designated TARGET GENE. C1orf24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C1orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:14976, to the

nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0348] Another function of GAM25 is therefore inhibition of Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24.

[0349] Chromosome 1 open reading frame 34 (C1orf34, Accession XP_027172.1) is another GAM25 target gene, herein designated TARGET GENE. C1orf34 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf34, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:4034, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0350] Another function of GAM25 is therefore inhibition of Chromosome 1 open reading frame 34 (C1orf34, Accession XP_027172.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34.

[0351] C3F (Accession NP_005759.2) is another GAM25 target gene, herein designated TARGET GENE. C3F BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C3F, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C3F BINDING SITE, designated SEQ ID:12542, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0352] Another function of GAM25 is therefore inhibition of C3F (Accession NP_005759.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3F.

[0353] C4orf9 (Accession XP_035572.1) is another GAM25 target gene, herein designated TARGET GENE. C4orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C4orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C4orf9 BINDING SITE, designated SEQ ID:4561, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also

designated SEQ ID:206.

[0354] Another function of GAM25 is therefore inhibition of C4orf9 (Accession XP_035572.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4orf9.

[0355] C6orf165 (Accession NP_849145.1) is another GAM25 target gene, herein designated TARGET GENE. C6orf165 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf165, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf165 BINDING SITE, designated SEQ ID:5162, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0356] Another function of GAM25 is therefore inhibition of C6orf165 (Accession NP_849145.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf165.

[0357] C6orf5 (Accession NP_056339.2) is another GAM25 target gene, herein designated TARGET GENE. C6orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf5, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:11730, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0358] Another function of GAM25 is therefore inhibition of C6orf5 (Accession NP_056339.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5.

[0359] Complement component 7 (C7, Accession NP_000578.1) is another GAM25 target gene, herein designated TARGET GENE. C7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C7 BINDING SITE, designated SEQ ID:17349, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0360] Another function of GAM25 is therefore inhibition of Complement component 7 (C7, Accession NP_000578.1) . Accordingly, utilities of GAM25 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with C7.

[0361] Chromosome 9 open reading frame 9 (C9orf9, Accession NP_061829.2) is another GAM25 target gene, herein designated TARGET GENE. C9orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C9orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:5324, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0362] Another function of GAM25 is therefore inhibition of Chromosome 9 open reading frame 9 (C9orf9, Accession NP_061829.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9.

[0363] Calneuron 1 (CALN1, Accession NP_113656.1) is another GAM25 target gene, herein designated TARGET GENE. CALN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:5444, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0364] Another function of GAM25 is therefore inhibition of Calneuron 1 (CALN1, Accession NP_113656.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1.

[0365] Calcium modulating ligand (CAMLG, Accession NP_001736.1) is another GAM25 target gene, herein designated TARGET GENE. CAMLG BINDING SITE1 and CAMLG BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CAMLG, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMLG BINDING SITE1 and CAMLG BINDING SITE2, designated SEQ ID:17054 and SEQ ID:15900 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0366] Another function of GAM25 is therefore inhibition of Calcium modulating ligand (CAMLG, Accession

NP_001736.1), a gene which is likely involved in the mobilization of calcium as a result of the tcr/cd3 complex interaction. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMLG.

[0367] The function of CAMLG has been established by previous studies. Calcium- modulating cyclophilin ligand was discovered by Bram and Crabtree (1994) in a 2- hybrid screen for signaling molecules that interact with cyclophilin B (OMIM Ref. No. 123841). It appears to be involved in the regulation of calcium signaling to T lymphocytes and other cells. The murine gene, symbolized Caml, was localized by interspecific backcross analysis of the middle of chromosome 13. By fluorescence in situ hybridization, Bram et al. (1996) localized the human CAMLG gene to chromosome 5q23, a region known to be syntenic to mouse chromosome 13.

[0368]

[0369] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0370] Bram, R. J.; Crabtree, G. R. : Calcium signalling in T cells stimulated by a cyclophilin B- binding protein. Nature

371: 355- 358, 1994. ; and

[0371] Bram, R. J.; Valentine, V.; Shapiro, D. N.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G. : The gene for calcium-modulating cyclophilin ligand (CAMLG) is located on human chromosome 5.

[0372] Further studies establishing the function and utilities of CAMLG are found in John Hopkins OMIM database record ID 601118, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-c motif) ligand 22 (CCL22, Accession NP_002981.2) is another GAM25 target gene, herein designated TARGET GENE. CCL22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCL22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL22 BINDING SITE, designated SEQ ID:11778, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0373] Another function of GAM25 is therefore inhibition of Chemokine (c-c motif) ligand 22 (CCL22, Accession NP_002981.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CCL22.

[0374] Cd209 antigen (CD209, Accession NP_066978.1) is another GAM25 target gene, herein designated TARGET GENE. CD209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD209, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD209 BINDING SITE, designated SEQ ID:18420, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0375] Another function of GAM25 is therefore inhibition of Cd209 antigen (CD209, Accession NP_066978.1), a gene which may play an important role in the CD4- independent association of HIV with cells. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD209.

[0376] The function of CD209 has been established by previous studies. DCs capture microorganisms that enter peripheral mucosal tissues, and then migrate to secondary lymphoid organs, where they present these in antigenic form to resting T cells, thus initiating adaptive immune responses. Geijtenbeek et al. (2000) described the properties of DC-

SIGN, which is highly expressed on DCs present in mucosal tissues and binds to the HIV- 1 envelope glycoprotein gp120. DCSIGN does not function as a receptor for viral entry into DCs but instead promotes efficient infection in trans of cells that express CD4 and chemokine receptors. Geijtenbeek et al. (2000) proposed that DCSIGN efficiently captures HIV- 1 in the periphery and facilitates its transport to secondary lymphoid organs rich in T cells, to enhance infection in trans of these target cells. The binding of the human immunodeficiency virus (HIV) envelope glycoprotein gp120 to the cell surface receptor CD4 (OMIM Ref. No. 186940) had been considered a primary determinant of viral tropism. A number of cell types, however, can be infected by the virus, or bind gp120, in the absence of CD4 expression. Human placenta had been identified as a tissue that binds gp120 in a CD4- independent manner. By expression cloning, Curtis et al. (1992) screened a placenta cDNA library and isolated a cDNA (clone 11) encoding a gp120- binding protein unrelated to CD4. The 1.3- kb cDNA predicts a 404- amino acid protein with a calculated molecular mass of 45,775 Da. The gp120- binding protein is organized into 3 domains: an N- terminal cytoplasmic and hydrophobic re-

gion, a set of tandem repeats (7 complete and 1 incomplete), and a C- terminal domain with homology to C- type (calcium- dependent) lectins. A type II membrane orientation (N- terminal cytoplasmic) was predicted both by the cDNA sequence and by the reactivity of C- terminal peptide- specific antiserum with the surface of clone 11- transfected cells. Native and recombinant gp120 and whole virus bound transfected cells. Gp120 binding was high affinity (Kd, 1.3 to 1.6 nM) and was inhibited by mannan, D- mannose, and L- fucose; once bound, gp120 was internalized rapidly. These data demonstrated that the gp120- binding protein is a membrane- associated mannose- binding lectin. Curtis et al. (1992) suggested that proteins of this type may play an important role in the CD4- independent association of HIV with cells.

[0377]

[0378] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0379] Geijtenbeek, T. B. H.; Kwon, D. S.; Torensma, R.; van Vliet, S. J.; van Duijnhoven, G. C. F.; Middel, J.; Cornelissen, I. L. M. H. A.; Nottet, H. S. L. M.; KewalRamani, V. N.; Littman, D. R.; Figdor, C. G.; van Kooyk, Y. : DC- SIGN, a dendritic

cell- specific HIV- 1- binding protein that enhances trans- infection of T cells. Cell 100: 587- 597, 2000. ; and

[0380] Curtis, B. M.; Scharnowske, S.; Watson, A. J. : Sequence and expression of a membrane- associated C- type lectin that exhibits CD4- independent binding of human im- munodeficiency virus enve.

[0381] Further studies establishing the function and utilities of CD209 are found in John Hopkins OMIM database record ID 604672, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd34 antigen (CD34, Accession NP_001764.1) is another GAM25 target gene, herein designated TARGET GENE. CD34 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD34, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com- plementarity of the nucleotide sequences of CD34 BIND- ING SITE, designated SEQ ID:18308, to the nucleotide se- quence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0382] Another function of GAM25 is therefore inhibition of Cd34 antigen (CD34, Accession NP_001764.1), a gene which is

a monomeric cell surface antigen that is selectively expressed on human hematopoietic progenitor cells. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD34.

[0383] The function of CD34 has been established by previous studies. CD34 is a monomeric cell surface antigen with a molecular mass of approximately 110 kD that is selectively expressed on human hematopoietic progenitor cells. In the hands of Sutherland et al. (1988), partial amino acid analysis of highly purified CD34 antigen revealed no significant sequence similarity with any previously described structures. Sequential immunoprecipitation and Western blot analysis indicated that this antigen is not a member of the leukosialin/sialophorin family, despite the fact that these molecules share several structural similarities.

[0384] Animal model experiments lend further support to the function of CD34. To analyze the involvement of CD34 in hematopoiesis, Cheng et al. (1996) produced both embryonic stem (ES) cells in mice null for the expression of this mucin. Analysis of yolk sac- like hematopoietic development in embryoid bodies derived from CD34- null ES cells showed a significant delay in both erythroid and myeloid

differentiation that could be reversed by transfection of the mutant ES cells with CD34 constructs expressing either a complete or truncated cytoplasmic domain. In spite of these diminished embryonic hematopoietic progenitor numbers, the CD34- null mice developed normally, and the hematopoietic profile of adult blood appeared typical. However, the colony- forming activity of hematopoietic progenitors derived from both bone marrow and spleen was significantly reduced in adult CD34- deficient animals.

[0385] It is appreciated that the abovementioned animal model for CD34 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0386] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0387] Cheng, J.; Baumhueter, S.; Cacalano, G.; Carver- Moore, K.; Thibodeaux, H.; Thomas, R.; Broxmeyer, H. E.; Cooper, S.; Hague, N.; Moore, M.; Lasky, L. A. : Hematopoietic defects in mice lacking the sialomucin CD34. Blood 87: 479-490, 1996. ; and

[0388] Sutherland, D. R.; Watt, S. M.; Dowden, G.; Karhi, K.;

Baker, M. A.; Greaves, M. F.; Smart, J. E. : Structural and partial amino acid sequence analysis of the human hemopoietic progenito.

[0389] Further studies establishing the function and utilities of CD34 are found in John Hopkins OMIM database record ID 142230, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cell division cycle 2-like 2 (CDC2L2, Accession NP_296370.1) is another GAM25 target gene, herein designated TARGET GENE. CDC2L2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CDC2L2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC2L2 BINDING SITE, designated SEQ ID:9240, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0390] Another function of GAM25 is therefore inhibition of Cell division cycle 2-like 2 (CDC2L2, Accession NP_296370.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC2L2.

[0391] CDCP1 (Accession NP_073753.3) is another GAM25 target gene, herein designated TARGET GENE. CDCP1 BINDING SITE1 and CDCP1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CDCP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDCP1 BINDING SITE1 and CDCP1 BINDING SITE2, designated SEQ ID:14151 and SEQ ID:19953 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0392] Another function of GAM25 is therefore inhibition of CDCP1 (Accession NP_073753.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDCP1.

[0393] Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NP_004351.1) is another GAM25 target gene, herein designated TARGET GENE. CDH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:2489, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0394] Another function of GAM25 is therefore inhibition of Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NP_004351.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1.

[0395] Cadherin 17, li cadherin (liver-intestine) (CDH17, Accession NP_004054.2) is another GAM25 target gene, herein designated TARGET GENE. CDH17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDH17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH17 BINDING SITE, designated SEQ ID:3901, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0396] Another function of GAM25 is therefore inhibition of Cadherin 17, li cadherin (liver-intestine) (CDH17, Accession NP_004054.2), a gene which may have a role in the morphological organization of liver and intestine and involved in intestinal peptide transport. Accordingly, utilities of

GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH17.

[0397] The function of CDH17 has been established by previous studies. The first step in oral absorption of many medically important peptide- based drugs, such as beta- lactam antibiotics, is mediated by an intestinal proton- dependent peptide transporter. Dantzig et al. (1994) identified a monoclonal antibody that blocked uptake of the beta- lactam cephalexin by human cells. By screening an expression library with this antibody, the authors isolated cDNAs encoding a protein that they designated 'human peptide transporter- 1,' or HPT1. Sequence analysis revealed that the predicted 832- amino acid protein shares several structural features with the cadherin superfamily of calcium- dependent cell- cell adhesion proteins. See 603006. Like the cadherins, HPT1 contains an extracellular region with conserved motifs and a transmembrane domain. However, HPT1 lacks the cytoplasmic domain found in other cadherins. Using immunohistochemical staining, Dantzig et al. (1994) localized HPT1 along the gastrointestinal tract and the pancreatic ducts, but not in kidney, lung, or several other tissues. Mammalian cells expressing HPT1 showed consistently higher cephalexin

uptake activity than controls. Uptake was dependent on an inwardly directed proton gradient.

[0398]

[0399] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0400] Dantzig, A. H.; Hoskins, J.; Tabas, L. B.; Bright, S.; Shepard, R. L.; Jenkins, I. L.; Duckworth, D. C.; Sportsman, J. R.; Mackensen, D.; Rosteck, P. R., Jr.; Skatrud, P. L. : Association of intestinal peptide transport with a protein related to the cadherin superfamily. Science 264: 430- 433, 1994. ; and

[0401] Kremmidiotis, G.; Baker, E.; Crawford, J.; Eyre, H. J.; Nahmias, J.; Callen, D. F. : Localization of human cadherin genes to chromosome regions exhibiting cancer- related loss of heteroz.

[0402] Further studies establishing the function and utilities of CDH17 are found in John Hopkins OMIM database record ID 603017, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carbohydrate (chondroitin) synthase 1 (CHSY1, Accession NP_055733.2) is another GAM25 target gene, herein designated TARGET GENE. CHSY1 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by CHSY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHSY1 BINDING SITE, designated SEQ ID:14947, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0403] Another function of GAM25 is therefore inhibition of Carbohydrate (chondroitin) synthase 1 (CHSY1, Accession NP_055733.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHSY1.

[0404] Cold autoinflammatory syndrome 1 (CIAS1, Accession NP_004886.2) is another GAM25 target gene, herein designated TARGET GENE. CIAS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CIAS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIAS1 BINDING SITE, designated SEQ ID:2330, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0405] Another function of GAM25 is therefore inhibition of Cold

autoinflammatory syndrome 1 (CIAS1, Accession NP_004886.2), a gene which may mediate protein- protein interactions; contains a leucine rich repeat and therefore may be associated with Familial cold autoinflammatory syndrome, muckle- wells syndrome. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Familial cold autoinflammatory syndrome, muckle- wells syndrome, and of other diseases and clinical conditions associated with CIAS1.

[0406] The function of CIAS1 has been established by previous studies. In a positional cloning effort to identify the gene mutated in familial cold autoinflammatory syndrome and Muckle- Wells syndrome, both of which map to 1q44, Hoffman et al. (2001) cloned and characterized the CIAS1 gene, so named for 'cold- induced autoinflammatory syndrome.' The full- length cDNA corresponds to a 9- exon gene encoding an open reading frame of 3,105 basepairs with 2 potential start codons in exon 1, with the second start codon meeting more Kozak criteria, and a stop codon at exon 9. Northern blot analysis identified a broad mRNA band of approximately 4 kb expressed at a low level in peripheral blood leukocytes; little or no expression was detectable in other tissues. Further analysis re-

vealed extensive alternative splicing of exons 4 through 8 that resulted in mRNAs ranging from 3,315 to 4,170 bp, consistent with the Northern blot analysis. The predicted protein encoded by the first splice form of CIAS1 (exons 1- 3, 5, and 7- 9), called cryopyrin, consists of 920 amino acids with a size of 105.7 kD and a PI of 6.16. The protein sequence contains several distinct motifs including a pyrin domain in the amino terminus (amino acids 13 through 83), a central nucleotide- binding site (NACHT subfamily) domain in exon 3 (amino acids 217 to 533), and a C- terminal leucine- rich repeat domain containing 7 leucine-rich repeats (amino acids 697 through 920). No nuclear localization signals were identified and no clear transmembrane regions were found. The largest protein potentially encoded by the 9 exons of CIAS1 consists of 1,034 amino acids with a size of 117.9 kD and 11 C- terminal leucine- rich repeats. Hoffman et al. (2001) suggested that cryopyrin is a signaling protein involved in the regulation of apoptosis. Dode et al. (2002) identified CIAS1 mutations, all located in exon 3, in 9 unrelated families with MWS and in 3 unrelated families with familial cold urticaria (FCU), originating from France, England, and Algeria. Five mutations were novel. The R260W mutation

(606416.0005) was identified in 2 families with MWS and in 2 families with FCU, of different ethnic origins, thereby demonstrating that a single CIAS1 mutation may cause both syndromes. This result indicated that modifier genes are involved in determining either an MWS or an FCU phenotype. The finding of the G569R mutation (606416.0006) in asymptomatic individuals further emphasized the importance of a modifier gene (or genes) in determining disease phenotype. The authors suggested that identification of modifiers was likely to have significant therapeutic implications for these severe diseases.

[0407]

[0408] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0409] Dode, C.; Le Du, N.; Cuisset, L.; Letourneur, F.; Berthelot, J.- M.; Vaudour, G.; Meyrier, A.; Watts, R. A.; Scott, D. G. [0410] Hoffman, H. M.; Mueller, J. L.; Broide, D. H.; Wanderer, A. A.; Kolodner, R. D. : Mutation of a new gene encoding a putative pyrin- like protein causes familial cold autoinflammatory syn.

[0411] Further studies establishing the function and utilities of CIAS1 are found in John Hopkins OMIM database record ID 606416, and in cited publications listed in Table 5, which are hereby incorporated by reference.CIP29 (Accession NP_115740.3) is another GAM25 target gene, herein designated TARGET GENE. CIP29 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CIP29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIP29 BINDING SITE, designated SEQ ID:12541, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0412] Another function of GAM25 is therefore inhibition of CIP29 (Accession NP_115740.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIP29.

[0413] Cytoskeleton associated protein 2 (CKAP2, Accession NP_060674.2) is another GAM25 target gene, herein des-

ignated TARGET GENE. CKAP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CKAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CKAP2 BINDING SITE, designated SEQ ID:6323, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0414] Another function of GAM25 is therefore inhibition of Cytoskeleton associated protein 2 (CKAP2, Accession NP_060674.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP2.

[0415] C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2) is another GAM25 target gene, herein designated TARGET GENE. CLECSF12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLECSF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE, designated SEQ ID:18038, to the nucleotide se-

quence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0416] Another function of GAM25 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2), a gene which is a pattern- recognition receptor . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF12.

[0417] The function of CLECSF12 has been established by previous studies. Yokota et al. (2001) cloned human dectin- 1 using degenerative PCR amplification of mRNA isolated from dendritic cells and subsequent cDNA cloning. The human dectin- 1 gene encodes a polypeptide of 247 amino acids, 3 amino acids longer than the mouse protein. Dectin- 1 contains an immunoreceptor tyrosine-based activation motif within the cytoplasmic domain. Human dectin- 1 mRNA is expressed predominantly in peripheral blood leukocytes and preferentially by dendritic cells. The mRNA encodes a 33- kD glycoprotein. In human epidermis, the protein is expressed selectively by Langerhans cells, which are an epidermal subset of dendritic cells. A truncated form of dectin- 1 RNA encodes a

polypeptide lacking almost the entire neck domain, which is required for accessibility of the carbohydrate recognition domain to ligands. Truncated dectin is produced by alternative splicing. Brown and Gordon (2001) identified dectin- 1 as a beta- glucan receptor present on macrophages. In contrast to its reported specificity for dendritic cells (Yokota et al. (2001), Brown and Gordon (2001)) found that dectin- 1 was expressed in every macrophage population examined and in more tissues than was previously reported with the highest expression being in the liver, lung, and thymus. Brown and Gordon (2001) found that dectin- 1 is a pattern- recognition receptor that recognizes a variety of beta- 1,3- linked and beta- 1,6- linked glucans from fungi and plants. Dectin-1 did not recognize monosaccharides or carbohydrates with different linkages. Laminarin and glucan phosphate, a structurally defined immunologically active beta- glucan, were the most effective inhibitors; both bind to the beta- glucan receptor on monocytes and macrophages. Soluble recombinant dectin- 1 stimulates the proliferation of T lymphocytes (Ariizumi et al. (2000)). In a whole- cell binding assay, binding of T cells to NIH 3T3 cells expressing dectin- 1 was not inhibited by beta- glucans. There-

fore, Brown and Gordon (2001) concluded that dectin- 1 has 2 ligand binding sites: one that recognizes an endogenous ligand on T cells, and another for exogenous carbohydrates.

[0418]

[0419] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0420] Ariizumi, K.; Shen, G.- L.; Shikano, S.; Xu, S.; Ritter, R., III; Kumamoto, T.; Edelbaum, D.; Morita, A.; Bergstresser, P. R.; Takashima, A. : Identification of a novel, dendritic cell-associated molecule, dectin- 1, by subtractive cDNA cloning. J. Biol. Chem. 275: 20157- 20167, 2000. ; and

[0421] Brown, G. D.; Gordon, S. : A new receptor for beta- glucans. Nature 413: 36- 37, 2001.

[0422] Further studies establishing the function and utilities of CLECSF12 are found in John Hopkins OMIM database record ID 606264, and in cited publications listed in Table 5, which are hereby incorporated by reference.2',3'-cyclic nucleotide 3' phosphodiesterase (CNP, Accession NP_149124.1) is another GAM25 target gene, herein designated TARGET GENE. CNP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA en-

coded by CNP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNP BINDING SITE, designated SEQ ID:16430, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0423] Another function of GAM25 is therefore inhibition of 2',3'-cyclic nucleotide 3' phosphodiesterase (CNP, Accession NP_149124.1), a gene which can link tubulin to membranes and may regulate cytoplasmic microtubule distribution. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNP.

[0424] The function of CNP has been established by previous studies. Cyclic nucleotide phosphodiesterase is a useful marker of myelin. CNPase is a membrane- bound enzyme found at high concentrations in central nervous system myelin and in the outer segments of photoreceptors in the retina (Vogel and Thompson, 1988). Two proteins with CNP activity are known to exist in brain and lymphoid tissues. They appear to be the products of distinct but related mRNA species. Kurihara et al. (1990) showed that the 2 gene products can arise by translation of 2 mRNAs

alternatively spliced from a single transcript. In bovine and human brain, there appears to be a single species of mRNA (Vogel and Thompson, 1988), and the bovine brain and retinal forms of the enzyme appear to be identical in sequence Bifulco et al. (2002) demonstrated that CNP is firmly associated with tubulin (OMIM Ref. No. 602529) from brain tissue and thyroid cells. They showed that CNP acts as a microtubule- associated protein in promoting microtubule assembly. This activity was found to reside in the C terminus of the enzyme. The authors concluded that CNP is a membrane- bound microtubule- associated protein that can link tubulin to membranes and may regulate cytoplasmic microtubule distribution

[0425]

[0426] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0427] Vogel, U. S.; Thompson, R. J. : Molecular structure, localization, and possible functions of the myelin- associated enzyme 2- prime,3- prime- cyclic nucleotide 3- prime- phosphodiesterase. J. Neurochem. 50: 1667- 1677, 1988. ; and

[0428] Bifulco, M.; Laezza, C.; Stingo, S.; Wolff, J. : 2- prime,3-

prime- cyclic nucleotide 3- prime- phosphodiesterase: a membrane- bound, microtubule- associated protein and membrane anchor for tub.

[0429] Further studies establishing the function and utilities of CNP are found in John Hopkins OMIM database record ID 123830, and in cited publications listed in Table 5, which are hereby incorporated by reference.Component of oligomeric golgi complex 3 (COG3, Accession NP_113619.1) is another GAM25 target gene, herein designated TARGET GENE. COG3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COG3 BINDING SITE, designated SEQ ID:12970, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0430] Another function of GAM25 is therefore inhibition of Component of oligomeric golgi complex 3 (COG3, Accession NP_113619.1), a gene which is critical for the structure and function of the Golgi apparatus. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with COG3.

[0431] The function of COG3 has been established by previous studies. Multiprotein complexes are key determinants of Golgi apparatus structure and its capacity for intracellular transport and glycoprotein modification. Several complexes have been identified, including the Golgi transport complex (GTC), the LDLC complex, which is involved in glycosylation reactions, and the SEC34 complex, which is involved in vesicular transport. These 3 complexes are identical and have been termed the conserved oligomeric Golgi (COG) complex, which includes COG3 (Ungar et al., 2002). By SDS- PAGE analysis of bovine brain cytosol, Ungar et al. (2002) identified the 8 subunits of the COG complex. Immunofluorescence microscopy demonstrated that COG1 (LDLB; 606973) colocalizes with COG7 (OMIM Ref. No. 606978), as well as with COG3 and COG5 (OMIM Ref. No. 606821), with a Golgi marker in a perinuclear distribution. Immunoprecipitation analysis showed that all COG subunits interact with COG2 (LDLC; 606974). Ungar et al. (2002) concluded that the COG complex is critical for the structure and function of the Golgi apparatus and can influence intracellular membrane trafficking

[0432]

[0436] Further studies establishing the function and utilities of COG3 are found in John Hopkins OMIM database record ID 606975, and in cited publications listed in Table 5, which are hereby incorporated by reference.Collectin sub-family member 12 (COLEC12, Accession NP_110408.2) is another GAM25 target gene, herein designated TARGET GENE. COLEC12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COLEC12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COLEC12 BIND-

ING SITE, designated SEQ ID:583, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0437] Another function of GAM25 is therefore inhibition of Collectin sub-family member 12 (COLEC12, Accession NP_110408.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC12.

[0438] Cox15 homolog, cytochrome c oxidase assembly protein (yeast) (COX15, Accession NP_510870.1) is another GAM25 target gene, herein designated TARGET GENE. COX15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:907, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0439] Another function of GAM25 is therefore inhibition of Cox15 homolog, cytochrome c oxidase assembly protein (yeast) (COX15, Accession NP_510870.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with COX15.

[0440] Carboxypeptidase a4 (CPA4, Accession NP_057436.1) is another GAM25 target gene, herein designated TARGET GENE. CPA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPA4 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0441] Another function of GAM25 is therefore inhibition of Carboxypeptidase a4 (CPA4, Accession NP_057436.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPA4.

[0442] cPLA2delta (Accession XP_208820.2) is another GAM25 target gene, herein designated TARGET GENE. cPLA2delta BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by cPLA2delta, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of cPLA2delta BINDING SITE, designated SEQ ID:7513, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0443] Another function of GAM25 is therefore inhibition of cPLA2delta (Accession XP_208820.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with cPLA2delta.

[0444] cPLA2delta (Accession NP_828848.1) is another GAM25 target gene, herein designated TARGET GENE. cPLA2delta BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by cPLA2delta, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of cPLA2delta BINDING SITE, designated SEQ ID:7513, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0445] Another function of GAM25 is therefore inhibition of cPLA2delta (Accession NP_828848.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with cPLA2delta.

[0446] Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XP_029311.2) is another GAM25 target gene, herein designated TARGET GENE. CPSF2 BINDING SITE1 and CPSF2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CPSF2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE1 and CPSF2 BINDING SITE2, designated SEQ ID:7665 and SEQ ID:4882 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0447] Another function of GAM25 is therefore inhibition of Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XP_029311.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2.

[0448] CRB3 (Accession NP_777378.1) is another GAM25 target gene, herein designated TARGET GENE. CRB3 BINDING SITE is a target binding site found in the 5` untranslated

region of multiple transcripts of mRNA encoded by CRB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRB3 BINDING SITE, designated SEQ ID:16619, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0449] Another function of GAM25 is therefore inhibition of CRB3 (Accession NP_777378.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRB3.

[0450] Cartilage associated protein (CRTAP, Accession NP_006362.1) is another GAM25 target gene, herein designated TARGET GENE. CRTAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRTAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:18797, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0451] Another function of GAM25 is therefore inhibition of Cartilage associated protein (CRTAP, Accession

NP_006362.1), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP.

[0452] The function of CRTAP has been established by previous studies. Castagnola et al. (1997) isolated a mouse Crtap cDNA from a subtracted library specific for mRNAs highly expressed in hypertrophic chondrocytes compared to proliferating and early differentiating chondrocytes. Using a mouse Crtap clone to screen a human fetal brain cDNA library, Tonachini et al. (1999) identified human CRTAP cDNA clones. Human CRTAP encodes a deduced 401-amino acid protein with a a putative signal peptide of 26 amino acids. CRTAP contains 2 potential N- glycosylation signals. CRTAP shares 89% amino acid sequence identity with mouse Crtap and 51% identity with the chick homolog. The mouse and human genes contain a C- terminal region of approximately 120 amino acids not present in the chick protein Using Northern blot analysis of human tissues, Tonachini et al. (1999) detected 2- kb and 4- kb CRTAP transcripts in brain, heart, kidney, lung, small intestine, and skeletal muscle. In all tissues except brain, the 2- kb transcript was more abundant. Using immuno-

histochemistry, the authors detected CRTAP expression in articular chondrocytes. In mouse, Morello et al. (1999) detected 3 Crtap transcripts in a range of tissues, including all mouse embryonic cartilages. In chick, Castagnola et al. (1997) detected a single Crtap transcript in a broad range of embryonic tissues with the strongest expression in the developing cartilage. They detected expression in the extracellular matrix of the forming cartilage surrounding the notochord, the developing sclera, the sphenoid and mandibular cartilage, the long bone cartilage, and the developing sternal cartilage

[0453]

[0454] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0455] Castagnola, P.; Gennari, M.; Morello, R.; Tonachini, L.; Marin, O.; Gaggero, A.; Cancedda, R. : Cartilage associated protein (CASP) is a novel developmentally regulated chick embryo protein. J. Cell Sci. 110: 1351- 1359, 1997. ; and

[0456] Morello, R.; Tonachini, L.; Monticone, M.; Viggiano, L.; Rocchi, M.; Cancedda, R.; Castagnola, P. : cDNA cloning, characterization and chromosome mapping of Crtap encoding the mouse carti.

[0457] Further studies establishing the function and utilities of CRTAP are found in John Hopkins OMIM database record ID 605497, and in cited publications listed in Table 5, which are hereby incorporated by reference.Casein kinase 2, alpha prime polypeptide (CSNK2A2, Accession NP_001887.1) is another GAM25 target gene, herein designated TARGET GENE. CSNK2A2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CSNK2A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSNK2A2 BINDING SITE, designated SEQ ID:19142, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0458] Another function of GAM25 is therefore inhibition of Casein kinase 2, alpha prime polypeptide (CSNK2A2, Accession NP_001887.1), a gene which catalyzes the phosphorylation of serine or threonine residues in proteins. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK2A2.

[0459] The function of CSNK2A2 has been established by previ-

ous studies. Phosphorylation of the human p53 protein (OMIM Ref. No. 191170) at ser392 is responsive to ultra- violet (UV) but not gamma irradiation. Keller et al. (2001) identified and purified a mammalian UV- activated protein kinase complex that phosphorylates ser392 in vitro. This kinase complex contains CK2 and the chromatin tran- scriptional elongation factor FACT, a heterodimer of SPT16 (OMIM Ref. No. 605012) and SSRP1 (OMIM Ref. No. 604328). In vitro studies showed that FACT alters the specificity of CK2 in the complex such that it selectively phosphorylates p53 over other substrates, including ca- sein. In addition, phosphorylation by the kinase complex was found to enhance p53 activity. These results provided a potential mechanism for p53 activation by UV irradiation Doray et al. (2002) demonstrated that the Golgi- local- ized, gamma- ear- containing adenosine diphosphate ri- bosylation factor- binding proteins (GGA1, 606004 and GGA3, 606006) and the coat protein adaptor protein- 1 (AP- 1) complex (see OMIM Ref. No. AP1G2, 603534) colocalize in clathrin- coated buds of the trans- Golgi networks of mouse L cells and human HeLa cells. Binding studies revealed a direct interaction between the hinge domains of the GGAs and the gamma- ear domain of AP-

1. Further, AP- 1 contained bound casein kinase- 2 that phosphorylated GGA1 and GGA3, thereby causing autoinhibition. Doray et al. (2002) demonstrated that this autoinhibition could induce the directed transfer of mannose 6- phosphate receptors (see OMIM Ref. No. 154540) from the GGAs to AP- 1. Mannose 6- phosphate receptors that were defective in binding to GGAs were poorly incorporated into adaptor protein complex containing clathrin coated vesicles. Thus, Doray et al. (2002) concluded that GGAs and the AP- 1 complex interact to package mannose 6- phosphate receptors into AP- 1- containing coated vesicles

[0460] Animal model experiments lend further support to the function of CSNK2A2. To determine the functional and developmental role of protein kinase casein kinase II, Xu et al. (1999) used homologous recombination to disrupt the gene encoding Csnk2a2 in transgenic mice. They found that Csnk2a2 is preferentially expressed in late stages of spermatogenesis, and male mice in which Csnk2a2 has been disrupted are infertile, with oligospermia and globozoospermia ('round- headed spermatozoa'). This was the first demonstration of the unique role for a Ck2 isoform in development. The primary spermatogenic

defect in the Csnk2a2 - /- testis is a specific abnormality of anterior head shaping of elongating spermatids; this is the first defined gene that regulates sperm head morphogenesis. As the germ cells differentiate, they are capable of undergoing chromatin condensation, although many abnormal cells are deleted through apoptosis or Sertoli cell phagocytosis. The few that survived to populate the epididymis exhibited head abnormalities similar to those described in human globozoospermia; thus, Csnk2a2 may be a candidate gene for inherited abnormalities of sperm morphogenesis

[0461] It is appreciated that the abovementioned animal model for CSNK2A2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0462] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0463] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP- 1 in packaging MPRs at the trans- Golgi network. Science 297: 1700- 1703, 2002. ; and

[0464] Xu, X.; Toselli, P. A.; Russell, L. D.; Seldin, D. C. : Globo-

zoospermia in mice lacking the casein kinase II alpha-prime catalytic subunit. Nature Genet. 23: 118- 121, 1999.

[0465] Further studies establishing the function and utilities of CSNK2A2 are found in John Hopkins OMIM database record ID 115442, and in cited publications listed in Table 5, which are hereby incorporated by reference.CTEN (Accession NP_116254.3) is another GAM25 target gene, herein designated TARGET GENE. CTEN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTEN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTEN BINDING SITE, designated SEQ ID:9806, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0466] Another function of GAM25 is therefore inhibition of CTEN (Accession NP_116254.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTEN.

[0467] Chemokine (c-x-c motif) ligand 16 (CXCL16, Accession NP_071342.1) is another GAM25 target gene, herein des-

ignated TARGET GENE. CXCL16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCL16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:3618, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0468] Another function of GAM25 is therefore inhibition of Chemokine (c-x-c motif) ligand 16 (CXCL16, Accession NP_071342.1), a gene which induces calcium mobilization. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL16.

[0469] The function of CXCL16 has been established by previous studies. Using a 2- step EST database search in which putative transcripts were scanned for the occurrence of functional patterns, Matloubian et al. (2000) identified a cDNA encoding a CXC chemokine that they termed CXCL16. The predicted 273- amino acid CXCL16 protein, which is 49% identical to the 246- amino acid mouse sequence, contains a non- glu/leu/arg (ELR) motif- contain-

ing CXC chemokine domain, a mucin- like spacer region, a transmembrane domain, and a cytoplasmic tail with a potential tyrosine phosphorylation and SH2 protein- binding site. CXCL16 was the first transmembrane CXC chemokine identified; CX3CL1 (SCYD1; 601880), which also has a mucin- like spacer region, was the only other known transmembrane chemokine. Northern blot analysis of mouse and human tissues detected a 2.2- kb CXCL16 transcript in spleen, lymph nodes, Peyer patches, lung, kidney, small intestine, and thymus, with weak expression in heart and liver and no expression in brain and bone marrow. Flow cytometry and Western blot analysis demonstrated expression of an approximately 60- kD glycosylated cell- surface protein as well as a cell supernatant 35- kD soluble protein. Flow cytometry of cells from mouse tissues indicated that CXCL16 is found on CD11C (ITGAX; 151510)- positive splenic and lymph node dendritic cells; this expression was increased after injection with lipopolysaccharide. Immunohistochemical analysis showed that CXCL16 is expressed in T- cell areas of the splenic white pulp, lymph nodes, the thymus medulla, and, interestingly, in the splenic red pulp. No staining was observed in B- cell areas. After injection of inflammatory

mediators, expression was enhanced in T- cell zones and, more prominently, in splenic red pulp. Chemotaxis assays found that CXCL16 induced a strong chemotactic response in activated CD8 T cells. In addition, CXCL16 induced calcium mobilization. Expression cloning of mouse Cxcl16 identified a protein with 71% amino acid identity to human BONZO (OMIM Ref. No. 605163), which Matloubian et al. (2000) renamed CXCR6. Human and mouse cells expressing CXCR6 showed a strong chemotactic response to CXCL16 but not to other chemokines. The authors concluded that CXCL16 and CXCR6 probably function in interactions between dendritic cells and T cells and in regulating T- cell migration in the splenic red pulp.

Macrophages endocytose oxidized low density lipoprotein (OxLDL) by a receptor- mediated mechanism. By expression cloning from a phorbol ester- stimulated THP- 1 cell library, Shimaoka et al. (2000) isolated a cDNA encoding SRPSOX (scavenger receptor that binds phophatidylserine and oxidized lipoprotein). The deduced 254- amino acid type I transmembrane protein is identical to the CXCL16 protein reported by Matloubian et al. (2000) except that SRPSOX differs by 2 residues and lacks the N- terminal 19 amino acids. Cells expressing SRPSOX bound to

phophatidylserine- coated plates; this binding could be inhibited by OxLDL. Scatchard analysis confirmed that SRPSOX is a specific receptor for OxLDL but not LDL or acetyl- LDL. Fluorescence microscopy demonstrated OxLDL uptake in SRPSOX- expressing cells. Immunoblot analysis showed that SRPSOX is expressed as a 30- kD protein in human and mouse macrophages. Northern blot analysis revealed differentiation- inducible expression of 1.8- and 2.5- kb transcripts in macrophages.

[0474] Further studies establishing the function and utilities of CXCL16 are found in John Hopkins OMIM database record

ID 605398, and in cited publications listed in Table 5, which are hereby incorporated by reference.CYCS (Accession NP_061820.1) is another GAM25 target gene, herein designated TARGET GENE. CYCS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYCS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYCS BINDING SITE, designated SEQ ID:18428, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0475] Another function of GAM25 is therefore inhibition of CYCS (Accession NP_061820.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYCS.

[0476] Chromosome y open reading frame 15b (CYorf15B, Accession NP_115965.1) is another GAM25 target gene, herein designated TARGET GENE. CYorf15B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CYorf15B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of CYorf15B BINDING SITE, designated SEQ ID:7001, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0477] Another function of GAM25 is therefore inhibition of Chromosome y open reading frame 15b (CYorf15B, Accession NP_115965.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYorf15B.

[0478] Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession NP_000752.1) is another GAM25 target gene, herein designated TARGET GENE. CYP1A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP1A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE, designated SEQ ID:1202, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0479] Another function of GAM25 is therefore inhibition of Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession

NP_000752.1), a gene which intervenes in an NADPH- dependent electron transport pathway. and therefore may be associated with Porphyria cutanea tarda. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Porphyria cutanea tarda, and of other diseases and clinical conditions associated with CYP1A2.

[0480] The function of CYP1A2 has been established by previous studies. P1- 450 (CYP1A1; 108330) and P3- 450 are 2 members of the dioxin- inducible P450 gene family. Jaiswal et al. (1987) determined the cDNA (3,064 bp) and protein (515 residues; M(r) = 58,294) sequences of P3-450. They showed by study of somatic cell hybrids that both the P3- 450 and the P1- 450 loci reside on human chromosome 15. In the mouse and hamster, the 2 genes are located near the equivalent of the mannosephosphate isomerase (MPI) locus (OMIM Ref. No. 154550). The same may be true in man; MPI is located in the region 15q22-qter. The 2 CYP1 genes are within 25 kb of each other and probably are not separated by other genes (Nebert, 1988). The enzyme involved in O- deethylation of phenacetin is 1 of 9 forms of cytochrome P- 450 that have been purified to electrophoretic homogeneity from human liver microsomes (Guengerich et al., 1986). Phenacetin O- deethy-

lase differs from another cytochrome P- 450 enzyme that shows genetic polymorphism, debrisoquine 4- hydroxylase (OMIM Ref. No. 124030), in molecular mass, amino acid composition, catalytic activity, and immunochemical properties. Butler et al. (1989) reviewed the evidence that phenacetin O- deethylase, otherwise known as P450(PA), is the product of the CYP1A2 gene. Devonshire et al. (1983) demonstrated a genetic polymorphism for phenacetin O- deethylation, with 5 to 10% of the population deficient in this activity. Cigarette smoking has been shown to increase microsomal phenacetin O- deethylase activity (Sesardic et al., 1988). Butler et al. (1989) reported that human hepatic microsomal caffeine 3- demethylation, the initial major step in caffeine biotransformation in humans, is selectively catalyzed by this cytochrome P-450. Estimation of caffeine 3- demethylation activity in humans may be useful in the characterization of arylamine N- oxidation phenotypes and in the assessment of whether or not the hepatic levels of this cytochrome, as affected by environmental or genetic factors, contribute to interindividual differences in susceptibility to arylamine-induced cancers. Smokers have been demonstrated to have increased rates of caffeine disposition, with plasma

half lives one- half that of nonsmokers. Furthermore, rates of caffeine metabolism vary between individuals, as caffeine half- life values ranging from 1.5 to 9.5 hours have been reported. Buters et al. (1996) showed that in mice the clearance of caffeine is determined primarily by CYP1A2.

[0481]

[0482] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0483] Butler, M. A.; Iwasaki, M.; Guengerich, F. P.; Kadlubar, F. F. : Human cytochrome P- 450(PA) (P- 450IA2), the phenacetin O- deethylase, is primarily responsible for the hepatic 3- demethylation of caffeine and N- oxidation of carcinogenic arylamines. Proc. Nat. Acad. Sci. 86: 7696-7700, 1989. ; and

[0484] Christiansen, L.; Bygum, A.; Jensen, A.; Thomsen, K.; Brandrup, F.; Horder, M.; Petersen, N. E. : Association be-tween CYP1A2 polymorphism and susceptibility to por-phyria cutanea tarda.

[0485] Further studies establishing the function and utilities of CYP1A2 are found in John Hopkins OMIM database record ID 124060, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Cytochrome p450, subfamily iib (phenobarbital-inducible), polypeptide 6 (CYP2B6, Accession NP_000758.1) is another GAM25 target gene, herein designated TARGET GENE. CYP2B6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP2B6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP2B6 BINDING SITE, designated SEQ ID:6624, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0486] Another function of GAM25 is therefore inhibition of Cytochrome p450, subfamily iib (phenobarbital-inducible), polypeptide 6 (CYP2B6, Accession NP_000758.1), a gene which oxidizes a variety of structurally unrelated compounds, including steroids, fatty acids, and xenobiotics. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2B6.

[0487] The function of CYP2B6 has been established by previous studies. Thum and Borlak (2000) investigated the gene expression of major human cytochrome P450 genes in

various regions of explanted hearts from 6 patients with dilated cardiomyopathy and 1 with transposition of the arterial trunk and 2 samples of normal heart. mRNA for cytochrome 2B6 was predominantly expressed in the right ventricle. A strong correlation between tissue- specific gene expression and enzyme activity was found. Thum and Borlak (2000) concluded that their findings showed that expression of genes for cytochrome P450 monooxgenases and verapamil metabolism are found predominantly in the right side of the heart, and suggested that this observation may explain the lack of efficacy of certain cardioselective drugs. Using a cloned cDNA that codes for a human ortholog of the phenobarbital- inducible cytochrome P450IIB subfamily in rodents, Santisteban et al. (1988) localized the CYP2B gene family to 19cen- q13.3 by Southern blot hybridization to DNA extracted from a panel of human- rodent somatic cell hybrids. Miles et al. (1988) established the chromosomal localization of the CYP2B gene subfamily to be 19q12- q13.2, close to the location of CYP2A (OMIM Ref. No. 123960), by Southern blot analysis of human- rodent somatic cell hybrids.

[0488]

[0489] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[0490] Santisteban, I.; Povey, S.; Shephard, E. A.; Phillips, I. R. : The major phenobarbital- inducible cytochrome P- 450 gene subfamily (P450IIB) mapped to the long arm of human chromosome 19. Ann. Hum. Genet. 52: 129- 135, 1988. ; and

[0491] Thum, T.; Borlak, J. : Gene expression in distinct regions of the heart. Lancet 355: 979- 983, 2000.

[0492] Further studies establishing the function and utilities of CYP2B6 are found in John Hopkins OMIM database record ID 605059, and in cited publications listed in Table 5, which are hereby incorporated by reference.CYP51A1 (Accession NP_000777.1) is another GAM25 target gene, herein designated TARGET GENE. CYP51A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP51A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP51A1 BINDING SITE, designated SEQ ID:17115, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0493] Another function of GAM25 is therefore inhibition of CYP51A1 (Accession NP_000777.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP51A1.

[0494] Cytochrome p450, subfamily viiib (sterol 12-alpha-hydroxylase), polypeptide 1 (CYP8B1, Accession NP_004382.1) is another GAM25 target gene, herein designated TARGET GENE. CYP8B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP8B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10741, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0495] Another function of GAM25 is therefore inhibition of Cytochrome p450, subfamily viiib (sterol 12-alpha-hydroxylase), polypeptide 1 (CYP8B1, Accession NP_004382.1), a gene which functions in bile acid biosynthesis. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1.

[0496] The function of CYP8B1 has been established by previous studies. Zhang and Chiang (2001) showed that hepatocyte nuclear factor- 4- alpha (HNF4A; 600281) strongly activates CYP8B1 promoter activity, whereas CYP7A promoter- binding factor (CPF, or NR5A2; 604453) has much less effect. The promoter activities were strongly repressed by bile acid. EMSA and site- directed mutagenesis analysis indicated that HNF4A, CPF, and the bile acid response element have overlapping binding sites in CYP8B1. Mammalian 2- hybrid analysis demonstrated interaction of HNF4A with the small heterodimer partner (SHP; 604630). Functional analysis determined that SHP represses HNF4A- induced CYP8B1 transcription. Zhang and Chiang (2001) concluded that bile acids repress human CYP8B1 transcription by reducing the transactivation activity of HNF4A through the interaction of HNF4A with SHP and a reduction of HNF4A expression in liver. Gafvels et al. (1999) obtained cDNAs encoding human and mouse CYP8B1. The deduced 501- amino acid human CYP8B1 protein is approximately 75% identical to the mouse and rabbit proteins. It contains a hydrophobic, membrane-spanning N terminus and conserved oxygen- binding, steroidogenic, and heme- binding segments. Northern

blot analysis revealed expression of a 3.9- kb CYP8B1 transcript in liver. In mouse, expression was restricted to liver.

[0497]

[0498] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0501] Further studies establishing the function and utilities of CYP8B1 are found in John Hopkins OMIM database record ID 602172, and in cited publications listed in Table 5, which are hereby incorporated by reference.Debranching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NP_057300.1) is another GAM25 target gene, herein des-

ignated TARGET GENE. DBR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DBR1 BINDING SITE, designated SEQ ID:19169, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0502] Another function of GAM25 is therefore inhibition of De-branching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NP_057300.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBR1.

[0503] Density-regulated protein (DENR, Accession XP_113714.2) is another GAM25 target gene, herein designated TARGET GENE. DENR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DENR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DENR BINDING SITE, designated SEQ ID:3444, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated

SEQ ID:206.

[0504] Another function of GAM25 is therefore inhibition of Density-regulated protein (DENR, Accession XP_113714.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DENR.

[0505] Density-regulated protein (DENR, Accession NP_003668.2) is another GAM25 target gene, herein designated TARGET GENE. DENR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DENR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DENR BINDING SITE, designated SEQ ID:3444, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0506] Another function of GAM25 is therefore inhibition of Density-regulated protein (DENR, Accession NP_003668.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DENR.

[0507] DKFZP434B044 (Accession NP_113664.1) is another

GAM25 target gene, herein designated TARGET GENE. DKFZP434B044 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434B044, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434B044 BINDING SITE, designated SEQ ID:5045, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0508] Another function of GAM25 is therefore inhibition of DKFZP434B044 (Accession NP_113664.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B044.

[0509] DKFZp434C0923 (Accession NP_060068.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZp434C0923 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434C0923, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE,

designated SEQ ID:3728, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0510] Another function of GAM25 is therefore inhibition of DKFZp434C0923 (Accession NP_060068.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923.

[0511] DKFZP434D146 (Accession NP_056410.2) is another GAM25 target gene, herein designated TARGET GENE. DKFZP434D146 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434D146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434D146 BINDING SITE, designated SEQ ID:10108, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0512] Another function of GAM25 is therefore inhibition of DKFZP434D146 (Accession NP_056410.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DKFZP434D146.

[0513] DKFZp434E2220 (Accession NP_060082.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZp434E2220 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp434E2220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0514] Another function of GAM25 is therefore inhibition of DKFZp434E2220 (Accession NP_060082.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220.

[0515] DKFZP434F0318 (Accession NP_110444.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZP434F0318 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:14934, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0516] Another function of GAM25 is therefore inhibition of DKFZP434F0318 (Accession NP_110444.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318.

[0517] DKFZp547H025 (Accession NP_064546.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZp547H025 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547H025, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:10247, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0518] Another function of GAM25 is therefore inhibition of DKFZp547H025 (Accession NP_064546.1) . Accordingly, util-

ities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025.

[0519] DKFZP564J0863 (Accession NP_056274.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZP564J0863 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564J0863, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564J0863 BINDING SITE, designated SEQ ID:2610, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0520] Another function of GAM25 is therefore inhibition of DKFZP564J0863 (Accession NP_056274.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564J0863.

[0521] DKFZP564O0523 (Accession NP_115496.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZP564O0523 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-

FZP564O0523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564O0523 BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0522] Another function of GAM25 is therefore inhibition of DKFZP564O0523 (Accession NP_115496.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0523.

[0523] DKFZP566I1024 (Accession NP_056226.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZP566I1024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:3248, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0524] Another function of GAM25 is therefore inhibition of DKFZP566I1024 (Accession NP_056226.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024.

[0525] DKFZp667B1218 (Accession NP_808881.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZp667B1218 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp667B1218, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667B1218 BINDING SITE, designated SEQ ID:19212, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0526] Another function of GAM25 is therefore inhibition of DKFZp667B1218 (Accession NP_808881.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667B1218.

[0527] DKFZp667E0512 (Accession XP_117353.1) is another GAM25 target gene, herein designated TARGET GENE. DK-

FZp667E0512 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZp667E0512, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667E0512 BINDING SITE, designated SEQ ID:19169, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0528] Another function of GAM25 is therefore inhibition of DK-FZp667E0512 (Accession XP_117353.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667E0512.

[0529] DKFZp761B107 (Accession NP_775734.1) is another GAM25 target gene, herein designated TARGET GENE. DK-FZp761B107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZp761B107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B107 BINDING SITE, designated SEQ ID:13045, to the nucleotide sequence of

GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0530] Another function of GAM25 is therefore inhibition of DKFZp761B107 (Accession NP_775734.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B107.

[0531] DKFZp761H039 (Accession NP_061181.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZp761H039 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761H039, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761H039 BINDING SITE, designated SEQ ID:16380, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0532] Another function of GAM25 is therefore inhibition of DKFZp761H039 (Accession NP_061181.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H039.

[0533] DKFZp761J139 (Accession NP_115656.1) is another GAM25 target gene, herein designated TARGET GENE. DKFZp761J139 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761J139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:17889, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0534] Another function of GAM25 is therefore inhibition of DKFZp761J139 (Accession NP_115656.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139.

[0535] DKFZp762H185 (Accession XP_172976.2) is another GAM25 target gene, herein designated TARGET GENE. DKFZp762H185 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp762H185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of DKFZp762H185 BINDING SITE, designated SEQ ID:18358, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0536] Another function of GAM25 is therefore inhibition of DKFZp762H185 (Accession XP_172976.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762H185.

[0537] Down syndrome critical region gene 6 (DSCR6, Accession NP_061835.1) is another GAM25 target gene, herein designated TARGET GENE. DSCR6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:13892, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0538] Another function of GAM25 is therefore inhibition of Down syndrome critical region gene 6 (DSCR6, Accession NP_061835.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with DSCR6.

[0539] DUSP18 (Accession NP_689724.2) is another GAM25 target gene, herein designated TARGET GENE. DUSP18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DUSP18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DUSP18 BINDING SITE, designated SEQ ID:17445, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0540] Another function of GAM25 is therefore inhibition of DUSP18 (Accession NP_689724.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP18.

[0541] EEF2K (Accession NP_037434.1) is another GAM25 target gene, herein designated TARGET GENE. EEF2K BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EEF2K, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EEF2K BINDING SITE, designated SEQ ID:1130, to the nucleotide se-

quence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0542] Another function of GAM25 is therefore inhibition of EEF2K (Accession NP_037434.1), a gene which phosphorylates serine or threonine on the eukaryotic elongation factor- 2 and therefore may be associated with Systemic lupus erythematosus and cancer. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Systemic lupus erythematosus and cancer, and of other diseases and clinical conditions associated with EEF2K.

[0543] The function of EEF2K has been established by previous studies. Using degenerate PCR primers based on worm and rabbit peptide sequences for Eef2k, followed by 5-prime and 3- prime RACE and RT- PCR on a glioma cell line, Ryazanov et al. (1997) obtained cDNAs encoding rodent and human EEF2K. The deduced 725- amino acid human protein is 90% identical to the rodent proteins. EEF2K lacks homology to other serine/threonine kinases or to other calmodulin- dependent kinases, apart from a glycine- rich loop that is part of the ATP- binding site. All EEF2K sequences contain a highly- conserved 200-residue catalytic domain. There is also a conserved C-terminal coiled- coil region. SDS- PAGE and functional

analysis showed expression of a 100- kD protein whose activity was strictly calmodulin- dependent. Northern blot analysis revealed ubiquitous expression of a major 3.1- kb transcript and minor 6.1- and 2.5- kb transcripts. Expression was particularly abundant in heart and skeletal muscle, suggesting that EEF2 phosphorylation may be particularly important in muscle. Arora et al. (2002) found that a majority of patients with systemic lupus erythematosus (SLE; 152700) have high titer anti- EEF2K antibodies capable of immunoprecipitating functional enzyme.

[0544]

[0545] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0546] Ryazanov, A. G.; Ward, M. D.; Mendola, C. E.; Pavur, K. S.; Dorovkov, M. V.; Wiedmann, M.; Erdjument- Bromage, H.; Tempst, P.; Parmer, T. G.; Prostko, C. R.; Germino, F. J.; Hait, W. N. : Identification of a new class of protein kinases represented by eukaryotic elongation factor- 2 kinase. Proc. Nat. Acad. Sci. 94: 4884- 4889, 1997. ; and

[0547] Arora, S.; Yang, J.- M.; Craft, J.; Hait, W. : Detection of anti- elongation factor 2 kinase (calmodulin- dependent

protein kinase III) antibodies in patients with systemic lupus erythemato.

[0548] Further studies establishing the function and utilities of EEF2K are found in John Hopkins OMIM database record ID 606968, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eh-domain containing 2 (EHD2, Accession NP_055416.2) is another GAM25 target gene, herein designated TARGET GENE. EHD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EHD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EHD2 BINDING SITE, designated SEQ ID:7811, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0549] Another function of GAM25 is therefore inhibition of Eh-domain containing 2 (EHD2, Accession NP_055416.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD2.

[0550] ELP3 (Accession NP_060561.3) is another GAM25 target gene, herein designated TARGET GENE. ELP3 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by ELP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELP3 BINDING SITE, designated SEQ ID:4705, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0551] Another function of GAM25 is therefore inhibition of ELP3 (Accession NP_060561.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELP3.

[0552] ET(B)R-LP-2 (Accession NP_004758.2) is another GAM25 target gene, herein designated TARGET GENE. ET(B)R-LP-2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ET(B)R-LP-2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ET(B)R-LP-2 BINDING SITE, designated SEQ ID:3185, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0553] Another function of GAM25 is therefore inhibition of

ET(B)R-LP-2 (Accession NP_004758.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ET(B)R-LP-2.

[0554] Ellis van creveld syndrome (EVC, Accession NP_055371.1) is another GAM25 target gene, herein designated TARGET GENE. EVC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EVC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:6657, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0555] Another function of GAM25 is therefore inhibition of Ellis van creveld syndrome (EVC, Accession NP_055371.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC.

[0556] Ellis van creveld syndrome (EVC, Accession NP_714928.1) is another GAM25 target gene, herein designated TARGET GENE. EVC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by EVC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:6657, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0557] Another function of GAM25 is therefore inhibition of Ellis van creveld syndrome (EVC, Accession NP_714928.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC.

[0558] Ecotropic viral integration site 5 (EVI5, Accession NP_005656.2) is another GAM25 target gene, herein designated TARGET GENE. EVI5 BINDING SITE1 and EVI5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by EVI5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE1 and EVI5 BINDING SITE2, designated SEQ ID:19835 and SEQ ID:19191 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0559] Another function of GAM25 is therefore inhibition of Ecotropic viral integration site 5 (EVI5, Accession NP_005656.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5.

[0560] Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NP_003941.1) is another GAM25 target gene, herein designated TARGET GENE. F2RL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F2RL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:18613, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0561] Another function of GAM25 is therefore inhibition of Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NP_003941.1), a gene which Protease- activated receptor 4; G protein- coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3.

[0562] The function of F2RL3 has been established by previous studies. Protease- activated receptors 1 (PAR1; 187930), 2 (PAR2; 600933), and 3 (PAR3; 601919) are members of a unique G protein- coupled receptor family. They are characterized by a tethered peptide ligand at the extracellular amino terminus that is generated by minor proteolysis. Xu et al. (1998) identified a partial cDNA sequence of a fourth member of this family, PAR4, in an expressed sequence tag (EST) database, and a full- length cDNA clone was isolated from a lymphoma Daudi cell cDNA library. The open reading frame coded for a 7- transmembrane domain protein of 385 amino acids with 33% amino acid sequence identity with PAR1- 3. A putative protease cleavage site was identified within the extracellular amino terminus. Northern blot analysis showed that PAR4 mRNA is expressed in a number of human tissues, with high levels being present in lung, pancreas, thyroid, testis, and small intestine. By fluorescence in situ hybridization, Xu et al. (1998) mapped the PAR4 gene to 19p12.

[0563] Animal model experiments lend further support to the function of F2RL3. Sambrano et al. (2001) demonstrated that platelets from Par4- deficient mice failed to change shape, mobilize calcium, secrete ATP, or aggregate in re-

sponse to thrombin.

[0564] It is appreciated that the abovementioned animal model for F2RL3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0565] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0566] Xu, W.- F.; Andersen, H.; Whitmore, T. E.; Presnell, S. R.; Yee, D. P.; Ching, A.; Gilbert, T.; Davie, E. W.; Foster, D. C. : Cloning and characterization of human protease- activated receptor 4. Proc. Nat. Acad. Sci. 95: 6642- 6646, 1998. ; and

[0567] Sambrano, G. R.; Weiss, E. J.; Zheng, Y.- W.; Huang, W.; Coughlin, S. R. : Role of thrombin signalling in platelets in haemostasis and thrombosis. Nature 413: 74- 78, 2001.

[0568] Further studies establishing the function and utilities of F2RL3 are found in John Hopkins OMIM database record ID 602779, and in cited publications listed in Table 5, which are hereby incorporated by reference.Coagulation factor iii (thromboplastin, tissue factor) (F3, Accession NP_001984.1) is another GAM25 target gene, herein designated TARGET GENE. F3 BINDING SITE is a target binding

site found in the 3` untranslated region of mRNA encoded by F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F3 BINDING SITE, designated SEQ ID:14357, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0569] Another function of GAM25 is therefore inhibition of Coagulation factor iii (thromboplastin, tissue factor) (F3, Accession NP_001984.1), a gene which functions in normal hemostasis. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F3.

[0570] The function of F3 has been established by previous studies. Factor III, a glycoprotein component of cell membranes, is an essential cofactor for factor VII- dependent activation of blood coagulation and activates the extrinsic pathway of blood coagulation in the presence of factor XII and calcium. It may be the primary physiologic initiator of blood coagulation. This may explain why factor III is the only protein in the coagulation pathway for which a congenital deficiency has not been described. Carson et al. (1985) mapped F3 to 1pter- p21 by study of somatic cell

hybrids with a species- specific sensitive chromogenic assay. Spicer et al. (1987) isolated cDNA clones for tissue factor. The amino acid sequence deduced from the nucleotide sequence of the cDNAs indicates that tissue factor is synthesized as a higher molecular weight precursor with a leader sequence of 32 amino acids, while the sequence of the mature protein suggests that there are 3 distinct domains: extracellular (residues 1- 219), hydrophobic (residues 220- 242), and cytoplasmic (residues 243- 263). Scarpati et al. (1987) screened a human placenta cDNA library in lambda- gt11 for expression of tissue factor antigens. Among 4 million recombinant clones screened, one that was positive expressed a protein that shares epitopes with authentic human brain tissue factor. The 1.1- kb cDNA insert encodes a peptide containing the N- terminal protein sequence of brain tissue factor. By means of this clone used in hybridization to flow- sorted human chromosomes, Scarpati et al. (1987) showed that the tissue factor gene is located on chromosome 1. Scarpati et al. (1987) used a RFLP to map factor 3 to proximal 1p by multipoint linkage analysis with probes known to span that region. Judging by the location arrived at by somatic cell hybridization, the location of F3 may be in

the region 1p22- p21. By in situ hybridization, Kao et al. (1988) likewise mapped F3 to 1p22- p21. Mackman et al. (1989) presented the complete sequence of the F3 gene. It is 12.4 kb long and has 6 exons separated by 5 introns. Mackman et al. (1990) concluded that the tissue factor promoter is relatively complex. Tissue factor (TF) is an integral membrane glycoprotein that, when exposed to plasma, is a potent procoagulant. As stated earlier, it is believed to be the physiologic initiator of blood coagulation. Toomey et al. (1997) found that, in contrast to findings of earlier studies which showed that TF- null mouse embryos did not survive beyond midgestation, 14% of TF-deficient embryos from a hybrid background escaped this early mortality and survived to birth. On gross and microscopic inspection, these late gestation, TF- deficient embryos appeared normal. Furthermore, the growth and vascularity of TF +/+, TF +/-, and TF - /- teratomas and teratocarcinomas were indistinguishable. Toomey et al. (1997) concluded that tumor- derived TF is not required for tumor growth and angiogenesis and that the combined data do not support an essential role for TF in embryonic vascular development.

[0571]

[0572] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0573] Mackman, N.; Fowler, B. J.; Edgington, T. S.; Morrissey, J. H. : Functional analysis of the human tissue factor promoter and induction by serum. Proc. Nat. Acad. Sci. 87: 2254- 2258, 1990. ; and

[0574] Toomey, J. R.; Kratzer, K. E.; Lasky, N. M.; Broze, G. J., Jr. : Effect of tissue factor deficiency on mouse and tumor development. Proc. Nat. Acad. Sci. 94: 6922- 6926, 1997.

[0575] Further studies establishing the function and utilities of F3 are found in John Hopkins OMIM database record ID 134390, and in cited publications listed in Table 5, which are hereby incorporated by reference.FAT3 (Accession XP_061871.5) is another GAM25 target gene, herein designated TARGET GENE. FAT3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FAT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FAT3 BINDING SITE, designated SEQ ID:421, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0576] Another function of GAM25 is therefore inhibition of FAT3 (Accession XP_061871.5) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT3.

[0577] Fc fragment of iga, receptor for (FCAR, Accession NP_579803.1) is another GAM25 target gene, herein designated TARGET GENE. FCAR BINDING SITE1 and FCAR BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by FCAR, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 and FCAR BINDING SITE2, designated SEQ ID:17765 and SEQ ID:17765 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0578] Another function of GAM25 is therefore inhibition of Fc fragment of iga, receptor for (FCAR, Accession NP_579803.1), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. and therefore may be associated with Iga nephropathy. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Iga

nephropathy., and of other diseases and clinical conditions associated with FCAR.

[0579] The function of FCAR has been established by previous studies. Human Fc- alpha receptor (FCAR) is present on a number of cell types, including neutrophils, monocytes, macrophages, and eosinophils. FCAR interacts with aggregated IgAs, such as IgA coated on the surface of an invading microorganism, and mediates several immunologic defense processes such as phagocytosis, antibody- dependent cell- mediated cytotoxicity, and stimulation of the release of inflammatory mediators. FCAR is a glycoprotein of 50 to 100 kD, with diversity on different cell types. Narita et al. (2001) examined polymorphisms in the promoter and 5- prime untranslated region of the FCAR gene in 151 patients with IgA nephropathy and 163 patients with other glomerular diseases shown to have no mesangial IgA deposition by renal biopsy. Haplotype analysis showed tight linkage disequilibrium among the polymorphisms. No significant association for the genotype, allele, and haplotype frequencies of the polymorphisms were shown between the patients with histologically proven IgA nephropathy and those with other glomerular diseases. Thus, the analyzed polymorphisms did not ap-

pear to be primarily involved in susceptibility to IgA nephropathy.

[0580]

[0581] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0582] Narita, I.; Goto, S.; Saito, N.; Sakatsume, M.; Jin, S.; Omori, K.; Gejyo, F. : Genetic polymorphisms in the promoter and 5- prime UTR region of the Fc alpha receptor (CD89) are not associated with a risk of IgA nephropathy. J. Hum. Genet. 46: 694- 698, 2001. ; and

tor for IgA. J. Exp. Med. 172: 1665- 1672, 1990.

[0612] Further studies establishing the function and utilities of FCAR are found in John Hopkins OMIM database record ID 147045, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fer-1-like 4 (c. elegans) (FER1L4, Accession XP_300246.1) is another GAM25 target gene, herein designated TARGET GENE. FER1L4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FER1L4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:4561, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0613] Another function of GAM25 is therefore inhibition of Fer-1-like 4 (c. elegans) (FER1L4, Accession XP_300246.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4.

[0614] Fer-1-like 4 (c. elegans) (FER1L4, Accession XP_300246.1) is another GAM25 target gene, herein designated TARGET GENE. FER1L4 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by FER1L4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:4561, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0615] Another function of GAM25 is therefore inhibition of Fer-1-like 4 (c. elegans) (FER1L4, Accession XP_300246.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4.

[0616] FLJ10232 (Accession NP_060503.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ10232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10232 BINDING SITE, designated SEQ ID:7686, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0617] Another function of GAM25 is therefore inhibition of

FLJ10232 (Accession NP_060503.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10232.

[0618] FLJ10298 (Accession NP_060520.2) is another GAM25 target gene, herein designated TARGET GENE. FLJ10298 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10298, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10298 BINDING SITE, designated SEQ ID:6660, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0619] Another function of GAM25 is therefore inhibition of FLJ10298 (Accession NP_060520.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10298.

[0620] FLJ10520 (Accession NP_060594.2) is another GAM25 target gene, herein designated TARGET GENE. FLJ10520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:18266, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0621] Another function of GAM25 is therefore inhibition of FLJ10520 (Accession NP_060594.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520.

[0622] FLJ10713 (Accession NP_060659.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ10713 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10713, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:6272, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0623] Another function of GAM25 is therefore inhibition of FLJ10713 (Accession NP_060659.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713.

[0624] FLJ10847 (Accession NP_060712.2) is another GAM25 tar-

get gene, herein designated TARGET GENE. FLJ10847 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10847, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10847 BINDING SITE, designated SEQ ID:14648, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0625] Another function of GAM25 is therefore inhibition of FLJ10847 (Accession NP_060712.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10847.

[0626] FLJ10871 (Accession NP_060720.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ10871 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10871, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10871 BINDING SITE, designated SEQ ID:12436, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0627] Another function of GAM25 is therefore inhibition of FLJ10871 (Accession NP_060720.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10871.

[0628] FLJ10922 (Accession NP_060743.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ10922 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:14510, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0629] Another function of GAM25 is therefore inhibition of FLJ10922 (Accession NP_060743.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922.

[0630] FLJ10936 (Accession NP_060749.2) is another GAM25 target gene, herein designated TARGET GENE. FLJ10936 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10936, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10936 BINDING SITE, designated SEQ ID:2724, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0631] Another function of GAM25 is therefore inhibition of FLJ10936 (Accession NP_060749.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10936.

[0632] FLJ11193 (Accession NP_060826.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ11193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11193 BINDING SITE, designated SEQ ID:17071, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0633] Another function of GAM25 is therefore inhibition of FLJ11193 (Accession NP_060826.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11193.

[0634] FLJ11710 (Accession NP_079122.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ11710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11710, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:6789, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0635] Another function of GAM25 is therefore inhibition of FLJ11710 (Accession NP_079122.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710.

[0636] FLJ11800 (Accession NP_079250.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ11800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11800 BINDING SITE, designated SEQ ID:11881, to the nucleotide sequence of GAM25 RNA, herein designated

GAM RNA, also designated SEQ ID:206.

[0637] Another function of GAM25 is therefore inhibition of FLJ11800 (Accession NP_079250.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11800.

[0638] FLJ12687 (Accession NP_079193.2) is another GAM25 target gene, herein designated TARGET GENE. FLJ12687 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12687, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12687 BINDING SITE, designated SEQ ID:7950, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0639] Another function of GAM25 is therefore inhibition of FLJ12687 (Accession NP_079193.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12687.

[0640] FLJ12903 (Accession NP_073590.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ12903 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12903, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:5568, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0641] Another function of GAM25 is therefore inhibition of FLJ12903 (Accession NP_073590.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903.

[0642] FLJ12973 (Accession NP_079184.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ12973 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12973 BINDING SITE, designated SEQ ID:5363, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0643] Another function of GAM25 is therefore inhibition of FLJ12973 (Accession NP_079184.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ12973.

[0644] FLJ12975 (Accession NP_079085.2) is another GAM25 target gene, herein designated TARGET GENE. FLJ12975 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12975 BINDING SITE, designated SEQ ID:1128, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0645] Another function of GAM25 is therefore inhibition of FLJ12975 (Accession NP_079085.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12975.

[0646] FLJ13114 (Accession NP_078817.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ13114 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:19143, to the

nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0647] Another function of GAM25 is therefore inhibition of FLJ13114 (Accession NP_078817.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114.

[0648] FLJ13188 (Accession NP_071346.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ13188 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13188, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13188 BINDING SITE, designated SEQ ID:8655, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0649] Another function of GAM25 is therefore inhibition of FLJ13188 (Accession NP_071346.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13188.

[0650] FLJ14106 (Accession NP_079343.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ14106 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ14106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14106 BINDING SITE, designated SEQ ID:2043, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0651] Another function of GAM25 is therefore inhibition of FLJ14106 (Accession NP_079343.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14106.

[0652] FLJ14442 (Accession NP_116174.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ14442 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:12170, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0653] Another function of GAM25 is therefore inhibition of FLJ14442 (Accession NP_116174.1) . Accordingly, utilities

of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442.

[0654] FLJ20045 (Accession NP_060108.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ20045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20045 BINDING SITE, designated SEQ ID:3234, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0655] Another function of GAM25 is therefore inhibition of FLJ20045 (Accession NP_060108.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20045.

[0656] FLJ20245 (Accession NP_060193.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ20245 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20245, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ20245 BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0657] Another function of GAM25 is therefore inhibition of FLJ20245 (Accession NP_060193.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20245.

[0658] FLJ20344 (Accession NP_060246.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ20344 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20344, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20344 BINDING SITE, designated SEQ ID:6297, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0659] Another function of GAM25 is therefore inhibition of FLJ20344 (Accession NP_060246.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20344.

[0660] FLJ20507 (Accession NP_060319.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ20507

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE, designated SEQ ID:14232, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0661] Another function of GAM25 is therefore inhibition of FLJ20507 (Accession NP_060319.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507.

[0662] FLJ20671 (Accession NP_060394.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ20671 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20671 BINDING SITE, designated SEQ ID:9310, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0663] Another function of GAM25 is therefore inhibition of

FLJ20671 (Accession NP_060394.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20671.

[0664] FLJ21302 (Accession NP_075052.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ21302 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21302, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21302 BINDING SITE, designated SEQ ID:11560, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0665] Another function of GAM25 is therefore inhibition of FLJ21302 (Accession NP_075052.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21302.

[0666] FLJ22529 (Accession NP_079065.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ22529 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ22529 BINDING SITE, designated SEQ ID:7859, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0667] Another function of GAM25 is therefore inhibition of FLJ22529 (Accession NP_079065.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22529.

[0668] FLJ22531 (Accession NP_078926.2) is another GAM25 target gene, herein designated TARGET GENE. FLJ22531 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22531, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22531 BINDING SITE, designated SEQ ID:1207, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0669] Another function of GAM25 is therefore inhibition of FLJ22531 (Accession NP_078926.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22531.

[0670] FLJ22794 (Accession NP_071357.1) is another GAM25 tar-

get gene, herein designated TARGET GENE. FLJ22794 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22794, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:15478, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0671] Another function of GAM25 is therefore inhibition of FLJ22794 (Accession NP_071357.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794.

[0672] FLJ23024 (Accession NP_079212.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ23024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:12540, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0673] Another function of GAM25 is therefore inhibition of FLJ23024 (Accession NP_079212.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024.

[0674] FLJ23040 (Accession NP_079450.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ23040 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23040, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23040 BINDING SITE, designated SEQ ID:18555, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0675] Another function of GAM25 is therefore inhibition of FLJ23040 (Accession NP_079450.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23040.

[0676] FLJ23556 (Accession NP_079156.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ23556 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23556, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:4537, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0677] Another function of GAM25 is therefore inhibition of FLJ23556 (Accession NP_079156.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23556.

[0678] FLJ30507 (Accession NP_694555.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ30507 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ30507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30507 BINDING SITE, designated SEQ ID:9488, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0679] Another function of GAM25 is therefore inhibition of FLJ30507 (Accession NP_694555.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30507.

[0680] FLJ30532 (Accession NP_653325.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ30532 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30532, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:5994, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0681] Another function of GAM25 is therefore inhibition of FLJ30532 (Accession NP_653325.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532.

[0682] FLJ31139 (Accession NP_775928.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ31139 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31139 BINDING SITE, designated SEQ ID:6914, to the nucleotide sequence of GAM25 RNA, herein designated

GAM RNA, also designated SEQ ID:206.

[0683] Another function of GAM25 is therefore inhibition of FLJ31139 (Accession NP_775928.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31139.

[0684] FLJ31166 (Accession NP_694567.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ31166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31166 BINDING SITE, designated SEQ ID:13479, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0685] Another function of GAM25 is therefore inhibition of FLJ31166 (Accession NP_694567.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31166.

[0686] FLJ31384 (Accession NP_689685.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ31384 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31384, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31384 BINDING SITE, designated SEQ ID:13568, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0687] Another function of GAM25 is therefore inhibition of FLJ31384 (Accession NP_689685.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31384.

[0688] FLJ32096 (Accession NP_776156.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ32096 BINDING SITE1 and FLJ32096 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ32096, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32096 BINDING SITE1 and FLJ32096 BINDING SITE2, designated SEQ ID:4882 and SEQ ID:5363 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0689] Another function of GAM25 is therefore inhibition of

FLJ32096 (Accession NP_776156.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32096.

[0690] FLJ32130 (Accession NP_689671.2) is another GAM25 target gene, herein designated TARGET GENE. FLJ32130 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32130, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32130 BINDING SITE, designated SEQ ID:19156, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0691] Another function of GAM25 is therefore inhibition of FLJ32130 (Accession NP_689671.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32130.

[0692] FLJ33655 (Accession NP_775912.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ33655 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33655, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ33655 BINDING SITE, designated SEQ ID:17105, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0693] Another function of GAM25 is therefore inhibition of FLJ33655 (Accession NP_775912.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33655.

[0694] FLJ33814 (Accession NP_775781.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ33814 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33814, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33814 BINDING SITE, designated SEQ ID:17298, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0695] Another function of GAM25 is therefore inhibition of FLJ33814 (Accession NP_775781.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33814.

[0696] FLJ34817 (Accession NP_689516.1) is another GAM25 tar-

get gene, herein designated TARGET GENE. FLJ34817 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34817 BINDING SITE, designated SEQ ID:4161, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0697] Another function of GAM25 is therefore inhibition of FLJ34817 (Accession NP_689516.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34817.

[0698] FLJ35487 (Accession NP_776181.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ35487 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35487 BINDING SITE, designated SEQ ID:19925, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0699] Another function of GAM25 is therefore inhibition of FLJ35487 (Accession NP_776181.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35487.

[0700] FLJ35721 (Accession NP_775955.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ35721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35721 BINDING SITE, designated SEQ ID:16439, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0701] Another function of GAM25 is therefore inhibition of FLJ35721 (Accession NP_775955.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35721.

[0702] FLJ37045 (Accession NP_787085.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ37045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37045, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37045 BINDING SITE, designated SEQ ID:14054, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0703] Another function of GAM25 is therefore inhibition of FLJ37045 (Accession NP_787085.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37045.

[0704] FLJ37433 (Accession NP_848612.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ37433 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37433, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37433 BINDING SITE, designated SEQ ID:13505, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0705] Another function of GAM25 is therefore inhibition of FLJ37433 (Accession NP_848612.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37433.

[0706] FLJ38149 (Accession XP_091919.5) is another GAM25 target gene, herein designated TARGET GENE. FLJ38149 BINDING SITE1 and FLJ38149 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ38149, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38149 BINDING SITE1 and FLJ38149 BINDING SITE2, designated SEQ ID:5834 and SEQ ID:14301 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0707] Another function of GAM25 is therefore inhibition of FLJ38149 (Accession XP_091919.5) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38149.

[0708] FLJ38281 (Accession NP_689814.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ38281 BINDING SITE1 and FLJ38281 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ38281, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of FLJ38281 BINDING SITE1 and FLJ38281 BINDING SITE2, designated SEQ ID:761 and SEQ ID:13396 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0709] Another function of GAM25 is therefore inhibition of FLJ38281 (Accession NP_689814.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38281.

[0710] FLJ38792 (Accession NP_848615.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ38792 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38792, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38792 BINDING SITE, designated SEQ ID:7709, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0711] Another function of GAM25 is therefore inhibition of FLJ38792 (Accession NP_848615.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38792.

[0712] FLJ38819 (Accession NP_665872.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ38819 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38819, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38819 BINDING SITE, designated SEQ ID:16529, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0713] Another function of GAM25 is therefore inhibition of FLJ38819 (Accession NP_665872.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38819.

[0714] FLJ39599 (Accession NP_776164.1) is another GAM25 target gene, herein designated TARGET GENE. FLJ39599 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39599, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39599 BINDING SITE, designated SEQ ID:14114, to the nucleotide sequence of GAM25 RNA, herein designated

GAM RNA, also designated SEQ ID:206.

[0715] Another function of GAM25 is therefore inhibition of FLJ39599 (Accession NP_776164.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39599.

[0716] Formin binding protein 1 (FNBP1, Accession XP_052666.3) is another GAM25 target gene, herein designated TARGET GENE. FNBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FNBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FNBP1 BINDING SITE, designated SEQ ID:4631, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0717] Another function of GAM25 is therefore inhibition of Formin binding protein 1 (FNBP1, Accession XP_052666.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNBP1.

[0718] Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NP_000139.1) is another GAM25

target gene, herein designated TARGET GENE. FUT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT1 BINDING SITE, designated SEQ ID:5787, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0719] Another function of GAM25 is therefore inhibition of Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NP_000139.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT1.

[0720] Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession NP_000142.1) is another GAM25 target gene, herein designated TARGET GENE. G6PC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by G6PC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5991, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0721] Another function of GAM25 is therefore inhibition of Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession NP_000142.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC.

[0722] Gamma-glutamyl carboxylase (GGCX, Accession NP_000812.2) is another GAM25 target gene, herein designated TARGET GENE. GGCX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GGCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GGCX BINDING SITE, designated SEQ ID:15130, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0723] Another function of GAM25 is therefore inhibition of Gamma-glutamyl carboxylase (GGCX, Accession NP_000812.2) . Accordingly, utilities of GAM25 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with GGCX.

[0724] Gm2 ganglioside activator protein (GM2A, Accession NP_000396.1) is another GAM25 target gene, herein designated TARGET GENE. GM2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GM2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GM2A BINDING SITE, designated SEQ ID:17079, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0725] Another function of GAM25 is therefore inhibition of Gm2 ganglioside activator protein (GM2A, Accession NP_000396.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A.

[0726] Guanine nucleotide binding protein (g protein), alpha 15 (gq class) (GNA15, Accession NP_002059.1) is another GAM25 target gene, herein designated TARGET GENE. GNA15 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GNA15, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNA15 BINDING SITE, designated SEQ ID:9918, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0727] Another function of GAM25 is therefore inhibition of Guanine nucleotide binding protein (g protein), alpha 15 (gq class) (GNA15, Accession NP_002059.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA15.

[0728] Guanine nucleotide binding protein (g protein), gamma 4 (GNG4, Accession NP_004476.1) is another GAM25 target gene, herein designated TARGET GENE. GNG4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:4561, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0729] Another function of GAM25 is therefore inhibition of Gua-

nine nucleotide binding protein (g protein), gamma 4 (GNG4, Accession NP_004476.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4.

[0730] Golgi autoantigen, golgin subfamily a, 3 (GOLGA3, Accession NP_005886.2) is another GAM25 target gene, herein designated TARGET GENE. GOLGA3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GOLGA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOLGA3 BINDING SITE, designated SEQ ID:2365, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0731] Another function of GAM25 is therefore inhibition of Golgi autoantigen, golgin subfamily a, 3 (GOLGA3, Accession NP_005886.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA3.

[0732] GPP34R (Accession NP_060648.2) is another GAM25 target gene, herein designated TARGET GENE. GPP34R BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by GPP34R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPP34R BINDING SITE, designated SEQ ID:6905, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0733] Another function of GAM25 is therefore inhibition of GPP34R (Accession NP_060648.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPP34R.

[0734] G protein-coupled receptor 48 (GPR48, Accession NP_060960.1) is another GAM25 target gene, herein designated TARGET GENE. GPR48 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR48, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR48 BINDING SITE, designated SEQ ID:15965, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0735] Another function of GAM25 is therefore inhibition of G protein-coupled receptor 48 (GPR48, Accession

NP_060960.1), a gene which binds to follicle- stimulating hormone and thyroid- stimulating hormone. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR48.

[0736] The function of GPR48 has been established by previous studies. By EST database searching with known GPCRs as queries, Hsu et al. (1998) identified ESTs encoding transmembrane domains 4 and 5 of human GPR48, which they called LGR4. By RT- PCR and repeated screening of a rat ovary cDNA library, they isolated a full- length cDNA encoding rat Lgr4. Sequence analysis predicted that the 951- amino acid rat Lgr4 protein contains a signal peptide; N- and C- flanking cysteine- rich sequences separated by 17 LRRs; 5 potential N- glycosylation sites; a transmembrane region; and a 145- residue cytoplasmic tail with multiple phosphorylation sites and a conserved potential protein kinase A (see OMIM Ref. No. 176911) phosphorylation site. Northern blot analysis of human tissues detected a 5.5- kb LGR4 transcript in multiple steroidogenic tissues and in a number of other tissues. Functional analysis showed that expression of a chimeric receptor composed of the extracellular domain of

luteinizing hormone receptor (OMIM Ref. No. 152790) with the transmembrane and cytoplasmic domains of Lgr4 resulted in binding of hCG (OMIM Ref. No. 118860) but no increase in basal production of cAMP, suggesting that LGR4 may signal through another mechanism. Loh et al. (2001) cloned human GPR48. Like rat Lgr4, the deduced human GPR48 protein has 951 amino acids and a similar structure. Northern blot analysis detected wide expression of GPR48 that was highest in pancreas. Within brain, highest expression of GPR48 was in hippocampus and amygdala. Expression of Gpr48 in mouse embryos occurred as early as embryonic day 7 and peaked at day 15.

[0737]

[0738] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0739] Hsu, S. Y.; Liang, S.- G.; Hsueh, A. J. W. : Characterization of two LGR genes homologous to gonadotropin and thyrotropin receptors with extracellular leucine- rich repeats and a G protein- coupled, seven- transmembrane region. Molec. Endocr. 12: 1830- 1845, 1998. ; and

[0740] Loh, E. D.; Broussard, S. R.; Kolakowski, L. F. : Molecular characterization of a novel glycoprotein hormone G- pro-

tein- coupled receptor. Biochem. Biophys. Res. Commun. 282: 757- 764, 2001.

[0741] Further studies establishing the function and utilities of GPR48 are found in John Hopkins OMIM database record ID 606666, and in cited publications listed in Table 5, which are hereby incorporated by reference.G protein-coupled receptor 56 (GPR56, Accession NP_005673.2) is another GAM25 target gene, herein designated TARGET GENE. GPR56 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPR56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR56 BINDING SITE, designated SEQ ID:7949, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0742] Another function of GAM25 is therefore inhibition of G protein-coupled receptor 56 (GPR56, Accession NP_005673.2), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR56.

[0743] The function of GPR56 has been established by previous studies. G protein- coupled receptors (GPRs), which are characterized by the presence of 7 transmembrane domains, are divided into several classes based on sequence characteristics. Class B GPRs, or the secretin- like receptors, include the secretin receptor (OMIM Ref. No. 182098) and the calcitonin receptor (OMIM Ref. No. 114131). The orphan receptors HE6 (OMIM Ref. No. 602657), CD97 (OMIM Ref. No. 601211), EMR1 (OMIM Ref. No. 600493), and BAI1 (OMIM Ref. No. 602682) share significant homology with class B GPRs across the 7- transmembrane region, but have a distinct N- terminal region containing a characteristic cysteine box, which precedes the first membrane- spanning domain, and a mucin- like domain. By PCR of human cDNAs with degenerate primers based on conserved regions from secretin- like receptors, Liu et al. (1999) isolated a cDNA encoding a novel receptor, which they designated GPR56. The predicted 693- amino acid GPR56 protein shares 26 to 32% sequence identity with the 4 class B- like orphan receptors. Like these receptors, GPR56 contains 7 transmembrane domains as well as a mucin- like domain and cysteine box in the N- terminal region. Northern blot analysis revealed that the GPR56

gene was expressed as a 3- kb mRNA in a wide range of tissues, with the highest levels in thyroid. Using in situ hybridization, Liu et al. (1999) determined that the GPR56 gene was expressed selectively within the monolayer of cuboidal epithelial cells of the smaller, more actively secreting follicles of human thyroid. The GPR56 gene contains 13 exons and spans approximately 15 kb. Using differential display, Zendman et al. (1999) identified a GPR56 cDNA as a transcript that was differentially expressed in melanoma cell lines with different metastatic potential. They designated the gene TM7XN1 (7- transmembrane protein with no EGF- like N- terminal domains- 1) because the protein lacks the EGF- like domains found in the related GPRs CD97 and EMR1. Zendman et al. (1999) reported that the TM7XN1 protein contains 687 amino acids. RT- PCR and Northern blot analyses indicated that TM7XN1 gene expression was inversely correlated with metastatic potential in melanoma cell lines.

[0744]

[0745] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0746] Liu, M.; Parker, R. M. C.; Darby, K.; Eyre, H. J.; Copeland,

N. G.; Crawford, J.; Gilbert, D. J.; Sutherland, G. R.; Jenkins, N. A.; Herzog, H. : GPR56, a novel secretin- like human G-protein- coupled receptor gene. Genomics 55: 296- 305, 1999. ; and

[0747] Zendman, A. J. W.; Cornelissen, I. M. H. A.; Weidle, U. H.; Ruiter, D. J.; van Muijen, G. N. P. : TM7XN1, a novel human EGF- TM7- like cDNA, detected with mRNA differential display using.

[0748] Further studies establishing the function and utilities of GPR56 are found in John Hopkins OMIM database record ID 604110, and in cited publications listed in Table 5, which are hereby incorporated by reference.G protein-coupled receptor 66 (GPR66, Accession NP_006047.2) is another GAM25 target gene, herein designated TARGET GENE. GPR66 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR66, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR66 BINDING SITE, designated SEQ ID:7428, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0749] Another function of GAM25 is therefore inhibition of G

protein-coupled receptor 66 (GPR66, Accession NP_006047.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR66.

[0750] G protein-coupled receptor 81 (GPR81, Accession NP_115943.1) is another GAM25 target gene, herein designated TARGET GENE. GPR81 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR81, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:12540, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0751] Another function of GAM25 is therefore inhibition of G protein-coupled receptor 81 (GPR81, Accession NP_115943.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81.

[0752] GRAF (Accession NP_055886.1) is another GAM25 target gene, herein designated TARGET GENE. GRAF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRAF, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ ID:3444, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0753] Another function of GAM25 is therefore inhibition of GRAF (Accession NP_055886.1), a gene which ia a GTPase activating protein for p21- rac and therefore may be associated with Juvenile myelomonocytic leukemia. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Juvenile myelomonocytic leukemia, and of other diseases and clinical conditions associated with GRAF.

[0754] The function of GRAF has been established by previous studies. Borkhardt et al. (2000) stated that mutual translocations involving 11q23 in acute leukemias had been demonstrated to show fusion between the mixed lineage leukemia (MLL; 159555) gene and a variety of different partner genes to a total of 23. The detection of a unique t(5;11)(q31;q23) in an infant with juvenile myelomonocytic leukemia and an MLL gene rearrangement provided an opportunity to clone another MLL fusion

partner gene. By cloning the breakpoints in this translocation, Borkhardt et al. (2000) recovered a member of the GTPase- activating protein (GAP) family, which they identified as the human homolog of the avian GRAF gene (Hildebrand et al., 1996). Ishikawa et al. (1998) cloned a GRAF cDNA, which they designated KIAA0621, from a human brain cDNA library and found that it encodes a deduced 753- amino acid protein with a molecular mass of 87 kD. Hildebrand et al. (1996) determined that the GRAF gene is highly homologous to the BCR gene (OMIM Ref. No. 151410), which is also involved in a leukemia- associated translocation. The avian GRAF protein binds to the C- terminal domain of pp125(FAK), one of the tyrosine kinases predicted to be a critical component of the integrin signaling transduction pathway, in an SH3 domain- dependent manner and stimulates the GTPase activity of the GTP- binding protein RhoA. Thus, GRAF acts as a negative regulator of RhoA.

[0755]

[0756] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0757] Borkhardt, A.; Bojesen, S.; Haas, O. A.; Fuchs, U.; Bartel-

heimer, D.; Loncarevic, I. F.; Bohle, R. M.; Harbott, J.; Repp, R.; Jaeger, U.; Viehmann, S.; Henn, T.; Korth, P.; Scharr, D.; Lampert, F. : The human GRAF gene is fused to MLL in a unique t(5;11)(q31;q23) and both alleles are disrupted in three cases of myelodysplastic syndrome/acute myeloid leukemia with a deletion 5q. Proc. Nat. Acad. Sci. 97: 9168- 9173, 2000. ; and

[0758] Hildebrand, J. D.; Taylor, J. M.; Parsons, T. J. : An SH3 domain- containing GTPase- activating protein for Rho and Cdc42 associates with focal adhesion kinase. Molec. Cell. Biol. 16: 31.

[0759] Further studies establishing the function and utilities of GRAF are found in John Hopkins OMIM database record ID 605370, and in cited publications listed in Table 5, which are hereby incorporated by reference.GRWD (Accession NP_113673.2) is another GAM25 target gene, herein designated TARGET GENE. GRWD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRWD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRWD BINDING SITE, designated SEQ ID:18015, to the nucleotide sequence of GAM25 RNA,

herein designated GAM RNA, also designated SEQ ID:206.

[0760] Another function of GAM25 is therefore inhibition of GRWD (Accession NP_113673.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRWD.

[0761] GSDM (Accession XP_209009.1) is another GAM25 target gene, herein designated TARGET GENE. GSDM BINDING SITE1 and GSDM BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by GSDM, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSDM BINDING SITE1 and GSDM BINDING SITE2, designated SEQ ID:19169 and SEQ ID:13018 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0762] Another function of GAM25 is therefore inhibition of GSDM (Accession XP_209009.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSDM.

[0763] General transcription factor iie, polypeptide 1, alpha 56kda (GTF2E1, Accession NP_005504.1) is another

GAM25 target gene, herein designated TARGET GENE. GTF2E1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GTF2E1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTF2E1 BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0764] Another function of GAM25 is therefore inhibition of General transcription factor iie, polypeptide 1, alpha 56kda (GTF2E1, Accession NP_005504.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2E1.

[0765] GTF2IRD2 (Accession NP_775808.1) is another GAM25 target gene, herein designated TARGET GENE. GTF2IRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GTF2IRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTF2IRD2 BINDING SITE, designated SEQ ID:5571, to the nucleotide sequence of GAM25 RNA,

herein designated GAM RNA, also designated SEQ ID:206.

[0766] Another function of GAM25 is therefore inhibition of GTF2IRD2 (Accession NP_775808.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2IRD2.

[0767] GTF2IRD2 (Accession NP_115579.3) is another GAM25 target gene, herein designated TARGET GENE. GTF2IRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GTF2IRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTF2IRD2 BINDING SITE, designated SEQ ID:5571, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0768] Another function of GAM25 is therefore inhibition of GTF2IRD2 (Accession NP_115579.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2IRD2.

[0769] GTPBG3 (Accession NP_116009.1) is another GAM25 target gene, herein designated TARGET GENE. GTPBG3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GTPBG3, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTPBG3 BINDING SITE, designated SEQ ID:13666, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0770] Another function of GAM25 is therefore inhibition of GTPBG3 (Accession NP_116009.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBG3.

[0771] H63 (Accession NP_816929.1) is another GAM25 target gene, herein designated TARGET GENE. H63 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H63, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H63 BINDING SITE, designated SEQ ID:2380, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0772] Another function of GAM25 is therefore inhibition of H63 (Accession NP_816929.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with H63.

[0773] H63 (Accession NP_612432.2) is another GAM25 target gene, herein designated TARGET GENE. H63 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H63, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H63 BINDING SITE, designated SEQ ID:2380, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0774] Another function of GAM25 is therefore inhibition of H63 (Accession NP_612432.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H63.

[0775] Hepatitis a virus cellular receptor 2 (HAVCR2, Accession NP_116171.2) is another GAM25 target gene, herein designated TARGET GENE. HAVCR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HAVCR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAVCR2 BINDING SITE, desig-

nated SEQ ID:14385, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0776] Another function of GAM25 is therefore inhibition of Hepatitis a virus cellular receptor 2 (HAVCR2, Accession NP_116171.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAVCR2.

[0777] HE9 (Accession NP_741997.1) is another GAM25 target gene, herein designated TARGET GENE. HE9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HE9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HE9 BINDING SITE, designated SEQ ID:6046, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0778] Another function of GAM25 is therefore inhibition of HE9 (Accession NP_741997.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HE9.

[0779] Hypoxia inducible factor 3, alpha subunit (HIF3A, Acces-

sion NP_690009.1) is another GAM25 target gene, herein designated TARGET GENE. HIF3A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HIF3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIF3A BINDING SITE, designated SEQ ID:10710, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0780] Another function of GAM25 is therefore inhibition of Hypoxia inducible factor 3, alpha subunit (HIF3A, Accession NP_690009.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIF3A.

[0781] Histamine receptor h4 (HRH4, Accession NP_067637.2) is another GAM25 target gene, herein designated TARGET GENE. HRH4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:5567,

to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0782] Another function of GAM25 is therefore inhibition of Histamine receptor h4 (HRH4, Accession NP_067637.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4.

[0783] HSD3B7 (Accession NP_079469.2) is another GAM25 target gene, herein designated TARGET GENE. HSD3B7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSD3B7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSD3B7 BINDING SITE, designated SEQ ID:18589, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0784] Another function of GAM25 is therefore inhibition of HSD3B7 (Accession NP_079469.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSD3B7.

[0785] HSPC065 (Accession NP_054876.2) is another GAM25 target gene, herein designated TARGET GENE. HSPC065

BINDING SITE1 and HSPC065 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HSPC065, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE1 and HSPC065 BINDING SITE2, designated SEQ ID:17865 and SEQ ID:2552 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0786] Another function of GAM25 is therefore inhibition of HSPC065 (Accession NP_054876.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065.

[0787] 5-hydroxytryptamine (serotonin) receptor 1d (HTR1D, Accession NP_000855.1) is another GAM25 target gene, herein designated TARGET GENE. HTR1D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR1D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTR1D BINDING SITE, designated SEQ ID:9485, to the nucleotide sequence

of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0788] Another function of GAM25 is therefore inhibition of 5-hydroxytryptamine (serotonin) receptor 1d (HTR1D, Accession NP_000855.1), a gene which belongs to g- protein coupled receptor. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR1D.

[0789] The function of HTR1D has been established by previous studies. The serotonin 1D receptor was initially characterized by radioligand binding procedures using membranes derived from bovine caudate nucleus. The 5- HT- 1D receptor is known to be a G protein- coupled receptor. Sumatriptan, an agent effective in the treatment of acute migraine, is the only ligand yet identified that is selective for the 5- HT- 1D receptor. Weinshank et al. (1992) reported the cloning, deduced amino acid sequences, pharmacologic properties, and second- messenger coupling of a pair of human 5- HT- 1D receptor genes, which they designated alpha and beta due to their strong similarities. Both genes have no introns in their coding regions, are expressed in the human cerebral cortex, and can couple to inhibition of adenylate cyclase activity. Their pharma-

cologic binding properties match closely those of human, bovine, and guinea pig 5- HT- 1D sites. Libert et al. (1991) obtained cDNA clones encoding 4 receptors of the G protein- coupled receptor family by selective amplification and cloning from thyroid cDNA. One of these clones, termed RDC4 by them, showed close structural similarity with the serotonin 5HT1A receptor (OMIM Ref. No. 109760). By in situ hybridization, they demonstrated that the gene (HTR1D) is located on chromosome 1 at 1p36.3-p34.3. By Southern blot analysis of a hybrid cell panel, Jin et al. (1992) showed that the HTR1D gene is located on chromosome 1. Wilkie et al. (1993) showed that the homologous gene in the mouse is located on chromosome 4.

[0790]

[0791] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0792] Weinshank, R. L.; Zgombick, J. M.; Macchi, M. J.; Branchek, T. A.; Hartig, P. R. : Human serotonin 1D receptor is encoded by a subfamily of two distinct genes: 5- HT(1D- alpha) and 5- HT(1D- beta). Proc. Nat. Acad. Sci. 89: 3630-3634, 1992. ; and

[0793] Wilkie, T. M.; Chen, Y.; Gilbert, D. J.; Moore, K. J.; Yu, L.; Simon, M. I.; Copeland, N. G.; Jenkins, N. A. : Identification, chromosomal location, and genome organization of mammalian.

[0794] Further studies establishing the function and utilities of HTR1D are found in John Hopkins OMIM database record ID 182133, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hyaluronoglucosaminidase 4 (HYAL4, Accession NP_036401.1) is another GAM25 target gene, herein designated TARGET GENE. HYAL4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HYAL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HYAL4 BINDING SITE, designated SEQ ID:4683, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0795] Another function of GAM25 is therefore inhibition of Hyaluronoglucosaminidase 4 (HYAL4, Accession NP_036401.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYAL4.

[0796] Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1) is another GAM25 target gene, herein designated TARGET GENE. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF1 BINDING SITE, designated SEQ ID:4732, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0797] Another function of GAM25 is therefore inhibition of Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1), a gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore may be associated with Growth retardation with sensorineural deafness and mental retardation. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Growth retardation with sensorineural deafness and mental retardation, and of other diseases and clinical conditions associated with IGF1.

[0798] The function of IGF1 has been established by previous

studies. By the solid- phase method, Li et al. (1983) synthesized human somatomedin C, which has 70 amino acid residues and 3 disulfide bridges. Using cDNA probes in the analysis of somatic cell hybrids, Brissenden et al. (1984) and Tricoli et al. (1984) independently assigned the IGF1 structural gene to chromosome 12. Tricoli et al. (1984) regionalized the locus tentatively to 12q22- qter, where the KRAS2 (OMIM Ref. No. 190070) gene is situated. This proximity, as well as that of the HRAS1 (OMIM Ref. No. 190020) and IGF2 (OMIM Ref. No. 147470) genes on 11p and that of the NRAS (OMIM Ref. No. 164790) and NGFB (OMIM Ref. No. 162030) genes in band 1p22, suggested to Brissenden et al. (1984) that a functional or evolutionary relationship may exist between members of the RAS family of protooncogenes and growth factor genes. Chromosomal abnormalities in the region of these genes have been associated with specific forms of neoplasia. Both IGF1 and IGF2 have a striking structural homology to proinsulin. Deficiency of IGF1 was proposed as the nature of the basic defect in the African pygmy (OMIM Ref. No. 265850) and possibly also in the Laron type of dwarfism (OMIM Ref. No. 262500). The homology of chromosomes 11 and 12 is supported by the finding of yet

another pair of structurally homologous loci on these 2 chromosomes. See 146000 for description of the work of Mullis et al. (1991) suggesting that the IGF1 gene may be the site of the mutation causing one form of hypochondroplasia. Using stored sera from men followed in the Baltimore Longitudinal Study on Aging, Harman et al. (2000) investigated whether the circulating IGF1 level is an independent predictor of prostate cancer and compared its predictive value with those of IGF2, IGFBP3, and prostate-specific antigen (PSA; 176820). High IGF1 and low IGF2 were independently associated with increased risk for prostate cancer, but PSA level was a much stronger predictor of prostate cancer than either IGF1 or IGF2. The absence of a relationship of IGF1 to prostate size is inconsistent with increased ascertainment in men with large prostates as the source of greater prostate cancer risk associated with IGF1. The authors concluded that IGF2 may inhibit both prostate growth and development of prostate cancer. Low birthweight is associated with later risk of type 2 diabetes and related disorders. Vaessen et al. (2002) studied the relationship between low birthweight and a polymorphism in the IGF1 gene that raises risk of type 2 diabetes and myocardial infarction. They recorded

birthweight and obtained DNA for 463 adults. Individuals who did not have the wildtype allele of the polymorphism had a 215- gram lower birthweight than those homozygous for the wildtype allele. The data lent support to the hypothesis that genetic variation affecting fetal growth could account for the association between low birthweight and susceptibility to diabetes and cardiovascular disease in later life. Postnatal growth and development are coordinated by genetic and environmental influences and numerous growth factors. Le Roith et al. (2001) reviewed the essential role that the GH- IGFI axis plays in these processes. Although the GH- IGFI axis is a closely coordinated system, both GH and IGFI have independent actions, many of which have become apparent more recently following the characterization of clinical syndromes and the development of mouse models. Genetic manipulation of mice has enabled investigators to reexamine many of the established hypotheses regarding the GH- IGFI axis. Results gleaned from a mouse model created by tissue-specific gene deletion of liver IGFI (Yakar et. al, 1999; Sjogren et al., 1999) enabled investigators to reevaluate the original 'somatomedin hypothesis.'

[0799] Animal model experiments lend further support to the

function of IGF1. Aging skeletal muscles suffer a steady decline in mass and functional performance, and compromised muscle integrity as fibrotic invasions replace contractile tissue. The same programmed deficits in muscle structure and function are found in numerous neurodegenerative syndromes and disease- related cachexia. Musaro et al. (2001) generated a model of persistent, functional myocyte hypertrophy using a tissue- restricted transgene encoding a locally acting isoform of Igf1 that is expressed in skeletal muscle. Transgenic embryos developed normally, and postnatal increases in muscle mass and strength were not accompanied by the additional pathologic changes seen in other Igf1 transgenic models. Expression of Gata2 (OMIM Ref. No. 137295), a transcription factor normally undetected in skeletal muscle, marked hypertrophic myocytes that escaped age- related muscle atrophy and retained the proliferative response to muscle injury characteristic of younger animals. The observations were thought to suggest usefulness of localized expression of this transgene as a clinical strategy for the treatment of age- or disease- related muscle frailty.

[0800] It is appreciated that the abovementioned animal model for IGF1 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0801] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0802] Musaro, A.; McCullagh, K.; Paul, A.; Houghton, L.; Dobrowolny, G.; Molinaro, M.; Barton, E. R.; Sweeney, H. L.; Rosenthal, N. : Localized Igf- 1 transgene expression sustains hypertrophy and regeneration in senescent skeletal muscle. Nature Genet. 27: 195- 200, 2001. ; and

[0803] Le Roith, D.; Scavo, L.; Butler, A. : What is the role of circulating IGF- I? Trends Endocr. Metab. 12: 48- 52, 2001.

[0804] Further studies establishing the function and utilities of IGF1 are found in John Hopkins OMIM database record ID 147440, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 11 (IL11, Accession NP_000632.1) is another GAM25 target gene, herein designated TARGET GENE. IL11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL11 BINDING SITE, desig-

nated SEQ ID:13505, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0805] Another function of GAM25 is therefore inhibition of Interleukin 11 (IL11, Accession NP_000632.1), a gene which stimulates the proliferation of hematopoietic stem cells and megakaryocyte progenitor cells and induces megakaryocyte maturation. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL11.

[0806] The function of IL11 has been established by previous studies. Paul et al. (1990) identified and cloned the gene for a new stromal cell- derived lymphopoietic and hematopoietic cytokine which they called interleukin- 11. The cDNA indicated a single reading frame of 597 nucleotides encoding a predicted 199- amino acid polypeptide. The IL11 produced in COS- 1 cells showed an apparent molecular mass of about 23 kD. McKinley et al. (1992) determined that the genomic sequence is 7 kb long and consists of 5 exons and 4 introns. Biologic characterization indicated that in addition to stimulating plasmacytoma proliferation, IL11 stimulates T- cell- dependent development of immunoglobulin- producing B cells and col-

laborates with IL3 in supporting murine megakaryocyte colony formation (Paul et al., 1990). Du and Williams (1994) reviewed the pleiotropic effects of IL11 on hematopoietic cells. Yang- Feng et al. (1991) demonstrated by in situ hybridization that a cDNA for IL11 maps to 19q13.3- q13.4. Since translocations involving 19q13 occur in patients with acute lymphocytic leukemia, the IL11 gene may be implicated. Du and Williams (1997) reviewed the molecular, cell biologic, and clinical aspects of interleukin- 11.

[0807]

[0808] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0809] Du, X.; Williams, D. A. : Interleukin- 11: review of molecular, cell biology, and clinical use. Blood 89: 3897- 3908, 1997. ; and

[0810] Du, X. X.; Williams, D. A. : Interleukin- 11: a multifunctional growth factor derived from the hematopoietic microenvironment. Blood 83: 2023- 2030, 1994.

[0811] Further studies establishing the function and utilities of IL11 are found in John Hopkins OMIM database record ID 147681, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Interleukin 19 (IL19, Accession NP_037503.2) is another GAM25 target gene, herein designated TARGET GENE. IL19 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IL19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL19 BINDING SITE, designated SEQ ID:6724, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0812] Another function of GAM25 is therefore inhibition of Interleukin 19 (IL19, Accession NP_037503.2), a gene which may play a role in B- cell activation and autoantibody production. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL19.

[0813] The function of IL19 has been established by previous studies. Interleukin- 10 (IL10; 124092) is a multifunctional cytokine that has antiinflammatory properties through its ability to downregulate antigen presentation and macrophage activation. It also plays a role in B- cell activation and autoantibody production. The IL10 family

of cytokines includes IL19, IL20 (OMIM Ref. No. 605619), MDA7 (OMIM Ref. No. 604136), and IL22 (OMIM Ref. No. 605330). By searching EST databases using IL10 as the probe, followed by screening an Epstein- Barr virus- transformed B- cell cDNA library, Gallagher et al. (2000) obtained a cDNA encoding IL19. Sequence analysis predicted that the 177- amino acid protein contains a signal peptide, 2 potential N- linked glycosylation sites, and 4 conserved cysteine residues necessary for correct folding of the IL10 monomer. IL19 shares 82% identity with IL10 in the hydrophobic core, but only 53% similarity in the putative IL10 receptor- alpha (OMIM Ref. No. 146933)- interacting residues. Northern blot kinetic analysis detected expression of IL10 before IL19 in lipopolysaccharide (LPS)- stimulated monocytes. IL19 expression was enhanced in the presence of IL4 (OMIM Ref. No. 147780) or IL13 (OMIM Ref. No. 147683), but not gamma- interferon (OMIM Ref. No. 147570), in LPS- stimulated monocytes. Granulocyte- macrophage colony- stimulating factor (GMCSF; 138960), but not other cytokines, was capable of inducing IL19 expression. Western blot analysis showed expression of a 35- to 40- kD protein that was reduced to 21 kD by glycosidase treatment. Genomic sequence anal-

ysis determined that the IL19 gene spans nearly 6 kb and, like IL10, contains 5 exons

[0814]

[0815] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0816] Blumberg, H.; Conklin, D.; Xu, W.; Grossmann, A.; Brender, T.; Carollo, S.; Eagan, M.; Foster, D.; Haldeman, B. A.; Hammond, A.; Haugen, H.; Jelinek, L.; and 14 others : Interleukin 20: discovery, receptor identification, and role in epidermal function. Cell 104: 9- 19, 2001. ; and

[0818] Further studies establishing the function and utilities of IL19 are found in John Hopkins OMIM database record ID 605687, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 28 receptor, alpha (IL28RA, Accession NP_775087.1) is another GAM25 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA

encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:13666, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0819] Another function of GAM25 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_775087.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[0820] Interleukin 28 receptor, alpha (IL28RA, Accession NP_734464.1) is another GAM25 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:13666, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0821] Another function of GAM25 is therefore inhibition of In-

terleukin 28 receptor, alpha (IL28RA, Accession NP_734464.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[0822] Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) is another GAM25 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:13666, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0823] Another function of GAM25 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[0824] INHBE (Accession NP_113667.1) is another GAM25 target gene, herein designated TARGET GENE. INHBE BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by INHBE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INHBE BINDING SITE, designated SEQ ID:17098, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0825] Another function of GAM25 is therefore inhibition of INHBE (Accession NP_113667.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBE.

[0826] Integrin, alpha x (antigen cd11c (p150), alpha polypeptide) (ITGAX, Accession NP_000878.1) is another GAM25 target gene, herein designated TARGET GENE. ITGAX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITGAX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGAX BINDING SITE, designated SEQ ID:5590, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0827] Another function of GAM25 is therefore inhibition of Inte-

grin, alpha x (antigen cd11c (p150), alpha polypeptide) (ITGAX, Accession NP_000878.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAX.

[0828] Janus kinase 3 (a protein tyrosine kinase, leukocyte) (JAK3, Accession NP_000206.1) is another GAM25 target gene, herein designated TARGET GENE. JAK3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JAK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JAK3 BINDING SITE, designated SEQ ID:9292, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0829] Another function of GAM25 is therefore inhibition of Janus kinase 3 (a protein tyrosine kinase, leukocyte) (JAK3, Accession NP_000206.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAK3.

[0830] Potassium inwardly-rectifying channel, subfamily j, member 11 (KCNJ11, Accession NP_000516.2) is another GAM25 target gene, herein designated TARGET GENE.

KCNJ11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KCNJ11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ11 BINDING SITE, designated SEQ ID:612, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0831] Another function of GAM25 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 11 (KCNJ11, Accession NP_000516.2), a gene which is controlled by g proteins. inward rectifier k+ channels are characterized by a greater tendancy to allow potassium to flow into the cell rather than out of it. and therefore is associated with Persistent hyperinsulinemic hypoglycemia of infancy. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Persistent hyperinsulinemic hypoglycemia of infancy, and of other diseases and clinical conditions associated with KCNJ11.

[0832] The function of KCNJ11 has been established by previous studies. ATP- sensitive potassium currents, I(KATP), were discovered in cardiac muscle and later found in pancreatic beta cells, pituitary tissue, skeletal muscle, brain, and

vascular and nonvascular smooth muscle. I(KATP) functions in secretion and muscle contraction by coupling metabolic activity to membrane potential. In pancreatic beta cells, ATP- potassium channels are crucial for the regulation of glucose- induced insulin secretion and are the target for the sulfonylureas, oral hypoglycemic agents widely used in the treatment of noninsulin- dependent diabetes mellitus (NIDDM; 125853), and for diazoxide, a potassium channel opener. The sulfonylurea receptor SUR (OMIM Ref. No. 600509) is a member of the ATP- binding cassette superfamily with multiple transmembrane- spanning domains and 2 potential nucleotide- binding folds. Truncation of SUR that removes the second nucleotide-binding fold causes familial persistent hyperinsulinemic hypoglycemia of infancy (see, OMIM Ref. No., for example, 600509.0001), a rare disorder of glucose homeostasis characterized by unregulated insulin secretion despite severe hypoglycemia. Although these observations imply that SUR is closely associated with, or even a subunit of, K(ATP) channels, expression of SUR alone had not produced a measurable I(KATP). Inagaki et al. (1995) cloned a member of the inwardly rectifying potassium channel family, which they called BIR or Kir6.2, in the nomencla-

ture of Chandy and Gutman (1993). The channel was expressed in large amounts in rat pancreatic islets and glucose- responsive insulin- secreting cell lines. The sequence showed a single open reading frame encoding a 390- amino acid protein with 2 putative transmembrane segments. The mouse homolog also had a single open reading frame encoding a 390- amino acid protein with 96% amino acid identity with human BIR, thus confirming that the gene encoding human BIR is intronless in the protein- coding region. Several other genes encoding inward rectifiers lack introns. This gene is also symbolized KCNJ11.

[0833] Animal model experiments lend further support to the function of KCNJ11. ATP- sensitive potassium channels are activated by various metabolic stresses, including hypoxia. The substantia nigra pars reticulata, the area with the highest expression of ATP- sensitive potassium channels in the brain, plays a pivotal role in the control of seizures. Yamada et al. (2001) studied mutant mice lacking the Kir6.2 subunit of ATP- sensitive potassium channels and found that they were susceptible to generalized seizures after brief hypoxia. In normal mice, the substantia nigra pars reticulata neuron activity was inactivated

during hypoxia by the opening of the postsynaptic ATP-sensitive potassium channels, whereas in knockout mice, the activity of these neurons was enhanced. ATP- sensitive potassium channels exert a depressant effect on substantia nigra pars reticulata neuronal activity during hypoxia and may be involved in the nigral protection mechanism against generalized seizures

[0834] It is appreciated that the abovementioned animal model for KCNJ11 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0835] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0836] Thomas, P. M.; Cote, G. J.; Hallman, D. M.; Mathew, P. M. : Homozygosity mapping, to chromosome 11p, of the gene for familial persistent hyperinsulinemic hypoglycemia of infancy. Am. J. Hum. Genet. 56: 416- 421, 1995. ; and

[0837] Yamada, K.; Ji, J. J.; Yuan, H.; Miki, T.; Sata, S.; Horimoto, N.; Shimizu, T.; Seino, S.; Inagaki, N. : Protective role of ATP- sensitive potassium channels in hypoxia- induced generalize.

[0838] Further studies establishing the function and utilities of

KCNJ11 are found in John Hopkins OMIM database record ID 600937, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0063 (Accession NP_055691.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:6721, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0839] Another function of GAM25 is therefore inhibition of KIAA0063 (Accession NP_055691.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0063.

[0840] KIAA0087 (Accession NP_055584.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0087 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:1183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0841] Another function of GAM25 is therefore inhibition of KIAA0087 (Accession NP_055584.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087.

[0842] KIAA0391 (Accession NP_055487.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0391 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0391, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:4805, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0843] Another function of GAM25 is therefore inhibition of KIAA0391 (Accession NP_055487.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0391.

[0844] KIAA0459 (Accession XP_027862.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0459 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0845] Another function of GAM25 is therefore inhibition of KIAA0459 (Accession XP_027862.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459.

[0846] KIAA0475 (Accession NP_055679.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0475 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:11244, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0847] Another function of GAM25 is therefore inhibition of KIAA0475 (Accession NP_055679.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475.

[0848] KIAA0495 (Accession XP_031397.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0495 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0495, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:10283, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0849] Another function of GAM25 is therefore inhibition of KIAA0495 (Accession XP_031397.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0495.

[0850] KIAA0513 (Accession NP_055547.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0513 BINDING SITE1 and KIAA0513 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0513, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE1 and KIAA0513 BINDING SITE2, designated SEQ ID:14774 and SEQ ID:13505 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0851] Another function of GAM25 is therefore inhibition of KIAA0513 (Accession NP_055547.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513.

[0852] KIAA0557 (Accession XP_085507.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0557 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:13127, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0853] Another function of GAM25 is therefore inhibition of KIAA0557 (Accession XP_085507.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557.

[0854] KIAA0561 (Accession XP_038150.2) is another GAM25 target gene, herein designated TARGET GENE. KIAA0561 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0561, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:14373, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0855] Another function of GAM25 is therefore inhibition of KIAA0561 (Accession XP_038150.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0561.

[0856] KIAA0605 (Accession NP_055509.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0605 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0605, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0605 BINDING SITE, designated SEQ ID:16135, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0857] Another function of GAM25 is therefore inhibition of KIAA0605 (Accession NP_055509.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0605.

[0858] KIAA0650 (Accession XP_113962.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0650 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0650, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA0650 BINDING SITE, designated SEQ ID:1046, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0859] Another function of GAM25 is therefore inhibition of KIAA0650 (Accession XP_113962.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0650.

[0860] KIAA0663 (Accession NP_055642.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0663 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:887, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0861] Another function of GAM25 is therefore inhibition of KIAA0663 (Accession NP_055642.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0663.

[0862] KIAA0682 (Accession NP_055667.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0682 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0682, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:9165, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0863] Another function of GAM25 is therefore inhibition of KIAA0682 (Accession NP_055667.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682.

[0864] KIAA0828 (Accession NP_056143.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0828 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0828, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0828 BINDING SITE, designated SEQ ID:8283, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0865] Another function of GAM25 is therefore inhibition of KIAA0828 (Accession NP_056143.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828.

[0866] KIAA0831 (Accession NP_055739.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0831 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:9780, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0867] Another function of GAM25 is therefore inhibition of KIAA0831 (Accession NP_055739.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831.

[0868] KIAA0889 (Accession NP_056192.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0889 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:18023, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0869] Another function of GAM25 is therefore inhibition of KIAA0889 (Accession NP_056192.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889.

[0870] KIAA0924 (Accession NP_055712.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA0924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:13300, to the

nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0871] Another function of GAM25 is therefore inhibition of KIAA0924 (Accession NP_055712.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924.

[0872] KIAA0935 (Accession XP_052620.6) is another GAM25 target gene, herein designated TARGET GENE. KIAA0935 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0935, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0935 BINDING SITE, designated SEQ ID:7586, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0873] Another function of GAM25 is therefore inhibition of KIAA0935 (Accession XP_052620.6) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0935.

[0874] KIAA0962 (Accession XP_290942.1) is another GAM25

target gene, herein designated TARGET GENE. KIAA0962 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0962, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0962 BINDING SITE, designated SEQ ID:8363, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0875] Another function of GAM25 is therefore inhibition of KIAA0962 (Accession XP_290942.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0962.

[0876] KIAA1002 (Accession XP_290584.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1002 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1002 BINDING SITE, designated SEQ ID:18510, to the nucleotide sequence of GAM25 RNA, herein designated

GAM RNA, also designated SEQ ID:206.

[0877] Another function of GAM25 is therefore inhibition of KIAA1002 (Accession XP_290584.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1002.

[0878] KIAA1040 (Accession XP_051091.3) is another GAM25 target gene, herein designated TARGET GENE. KIAA1040 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1040, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:19942, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0879] Another function of GAM25 is therefore inhibition of KIAA1040 (Accession XP_051091.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040.

[0880] KIAA1041 (Accession NP_055762.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1041

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1041, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:16595, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0881] Another function of GAM25 is therefore inhibition of KIAA1041 (Accession NP_055762.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041.

[0882] KIAA1170 (Accession XP_045907.2) is another GAM25 target gene, herein designated TARGET GENE. KIAA1170 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0883] Another function of GAM25 is therefore inhibition of KIAA1170 (Accession XP_045907.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170.

[0884] KIAA1185 (Accession NP_065761.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1185 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1185 BINDING SITE, designated SEQ ID:7542, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0885] Another function of GAM25 is therefore inhibition of KIAA1185 (Accession NP_065761.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1185.

[0886] KIAA1198 (Accession NP_065765.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1198 BINDING SITE1 through KIAA1198 BINDING SITE3 are tar-

get binding sites found in untranslated regions of mRNA encoded by KIAA1198, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE1 through KIAA1198 BINDING SITE3, designated SEQ ID:17079, SEQ ID:14842 and SEQ ID:9534 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0887] Another function of GAM25 is therefore inhibition of KIAA1198 (Accession NP_065765.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198.

[0888] KIAA1257 (Accession XP_031577.2) is another GAM25 target gene, herein designated TARGET GENE. KIAA1257 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated

GAM RNA, also designated SEQ ID:206.

[0889] Another function of GAM25 is therefore inhibition of KIAA1257 (Accession XP_031577.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257.

[0890] KIAA1268 (Accession XP_291055.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1268 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1268 BINDING SITE, designated SEQ ID:11503, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0891] Another function of GAM25 is therefore inhibition of KIAA1268 (Accession XP_291055.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1268.

[0892] KIAA1273 (Accession XP_300760.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1273

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1273, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1273 BINDING SITE, designated SEQ ID:16475, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0893] Another function of GAM25 is therefore inhibition of KIAA1273 (Accession XP_300760.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1273.

[0894] KIAA1465 (Accession XP_027396.4) is another GAM25 target gene, herein designated TARGET GENE. KIAA1465 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1465, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:11959, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0895] Another function of GAM25 is therefore inhibition of KIAA1465 (Accession XP_027396.4) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465.

[0896] KIAA1493 (Accession XP_034415.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1493 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:6658, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0897] Another function of GAM25 is therefore inhibition of KIAA1493 (Accession XP_034415.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493.

[0898] KIAA1530 (Accession XP_042661.5) is another GAM25 target gene, herein designated TARGET GENE. KIAA1530 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1530, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:2247, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0899] Another function of GAM25 is therefore inhibition of KIAA1530 (Accession XP_042661.5) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530.

[0900] KIAA1571 (Accession XP_027744.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1571 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1571, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:13505, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0901] Another function of GAM25 is therefore inhibition of

KIAA1571 (Accession XP_027744.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1571.

[0902] KIAA1615 (Accession NP_066002.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1615 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1615, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:16197, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0903] Another function of GAM25 is therefore inhibition of KIAA1615 (Accession NP_066002.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615.

[0904] KIAA1671 (Accession XP_037809.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1671 BINDING SITE1 and KIAA1671 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by KIAA1671, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE1 and KIAA1671 BINDING SITE2, designated SEQ ID:613 and SEQ ID:6719 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0905] Another function of GAM25 is therefore inhibition of KIAA1671 (Accession XP_037809.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671.

[0906] KIAA1737 (Accession NP_219494.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1737 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:1130, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0907] Another function of GAM25 is therefore inhibition of KIAA1737 (Accession NP_219494.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737.

[0908] KIAA1784 (Accession NP_115820.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1784 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1784 BINDING SITE, designated SEQ ID:16595, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0909] Another function of GAM25 is therefore inhibition of KIAA1784 (Accession NP_115820.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1784.

[0910] KIAA1827 (Accession XP_290834.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1827 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1827, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1827 BINDING SITE, designated SEQ ID:16595, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0911] Another function of GAM25 is therefore inhibition of KIAA1827 (Accession XP_290834.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1827.

[0912] KIAA1836 (Accession XP_114087.2) is another GAM25 target gene, herein designated TARGET GENE. KIAA1836 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1836, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1836 BINDING SITE, designated SEQ ID:4984, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0913] Another function of GAM25 is therefore inhibition of

KIAA1836 (Accession XP_114087.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1836.

[0914] KIAA1971 (Accession XP_058720.4) is another GAM25 target gene, herein designated TARGET GENE. KIAA1971 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:9625, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0915] Another function of GAM25 is therefore inhibition of KIAA1971 (Accession XP_058720.4) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971.

[0916] KIAA1987 (Accession XP_113870.1) is another GAM25 target gene, herein designated TARGET GENE. KIAA1987 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1987, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:3377, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0917] Another function of GAM25 is therefore inhibition of KIAA1987 (Accession XP_113870.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987.

[0918] KIAA2028 (Accession XP_059415.2) is another GAM25 target gene, herein designated TARGET GENE. KIAA2028 BINDING SITE1 and KIAA2028 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA2028, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2028 BINDING SITE1 and KIAA2028 BINDING SITE2, designated SEQ ID:3481 and SEQ ID:4224 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0919] Another function of GAM25 is therefore inhibition of KIAA2028 (Accession XP_059415.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2028.

[0920] Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NP_005037.1) is another GAM25 target gene, herein designated TARGET GENE. KLK7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KLK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLK7 BINDING SITE, designated SEQ ID:2523, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0921] Another function of GAM25 is therefore inhibition of Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NP_005037.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK7.

[0922] Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NP_644806.1) is another GAM25 target gene,

herein designated TARGET GENE. KLK7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KLK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLK7 BINDING SITE, designated SEQ ID:2523, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0923] Another function of GAM25 is therefore inhibition of Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NP_644806.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK7.

[0924] Kinase suppressor of ras (KSR, Accession XP_290793.1) is another GAM25 target gene, herein designated TARGET GENE. KSR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KSR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KSR BINDING SITE, designated SEQ ID:9413, to the nucleotide sequence of GAM25 RNA, herein designated GAM

RNA, also designated SEQ ID:206.

[0925] Another function of GAM25 is therefore inhibition of Kinase suppressor of ras (KSR, Accession XP_290793.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KSR.

[0926] Lysosomal-associated membrane protein 3 (LAMP3, Accession NP_055213.1) is another GAM25 target gene, herein designated TARGET GENE. LAMP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAMP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAMP3 BINDING SITE, designated SEQ ID:3444, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0927] Another function of GAM25 is therefore inhibition of Lysosomal-associated membrane protein 3 (LAMP3, Accession NP_055213.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP3.

[0928] LIPT1 (Accession NP_057013.1) is another GAM25 target

gene, herein designated TARGET GENE. LIPT1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LIPT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIPT1 BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0929] Another function of GAM25 is therefore inhibition of LIPT1 (Accession NP_057013.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPT1.

[0930] LIPT1 (Accession NP_660198.1) is another GAM25 target gene, herein designated TARGET GENE. LIPT1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LIPT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIPT1 BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0931] Another function of GAM25 is therefore inhibition of LIPT1 (Accession NP_660198.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPT1.

[0932] LIPT1 (Accession NP_660199.1) is another GAM25 target gene, herein designated TARGET GENE. LIPT1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LIPT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIPT1 BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0933] Another function of GAM25 is therefore inhibition of LIPT1 (Accession NP_660199.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPT1.

[0934] LNIR (Accession NP_112178.1) is another GAM25 target gene, herein designated TARGET GENE. LNIR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LNIR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LNIR BINDING SITE, designated SEQ ID:14735, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0935] Another function of GAM25 is therefore inhibition of LNIR (Accession NP_112178.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNIR.

[0936] LNK (Accession NP_005466.1) is another GAM25 target gene, herein designated TARGET GENE. LNK BINDING SITE1 and LNK BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LNK, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE1 and LNK BINDING SITE2, designated SEQ ID:6553 and SEQ ID:19673 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0937] Another function of GAM25 is therefore inhibition of LNK (Accession NP_005466.1), a gene which links T- cell receptor activation signal to phospholipase c- gamma- 1,

grb- 2 and phosphatidylinositol 3- kinase (by similarity). Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK.

[0938] The function of LNK has been established by previous studies. .By PCR using primers based on the rat Lnk sequence and by screening a Jurkat cDNA library, Li et al. (2000) obtained a cDNA encoding human LNK. Sequence analysis predicted that the 575- amino acid LNK protein contains an N- terminal proline- rich region, a pleckstrin homology (PH) domain, and an Src homology 2 (SH2) domain; the PH and SH2 domains are similar to those of the APS protein. Northern blot analysis detected low expression of a 6.8- kb LNK transcript in various lymphoid cell lines. Confocal fluorescence microscopy showed that the majority of LNK is located in the juxtanuclear region with some found near the plasma membrane. Immunoprecipitation analysis demonstrated that LNK is phosphorylated by LCK (OMIM Ref. No. 153390) but not by SYK (OMIM Ref. No. 600085) and that LNK binds to the tyrosine- phosphorylated TCR zeta chain via its SH2 domain. Functional analysis indicated that LNK inhibits the activation of NFAT (see OMIM Ref. No. 600489) in stimulated T cells

[0939] Animal model experiments lend further support to the function of LNK. Takaki et al. (2000) generated Lnk- deficient mice and found that although they had unimpaired T- cell development in thymus, pre- B and immature B cells accumulated in enlarged spleens. In bone marrow, there was also an increase in B- lineage cells, reflecting enhanced production of B- cell progenitors due in part to hypersensitivity to SCF (KITLG; 184745) in the presence or absence of IL7 (OMIM Ref. No. 146660). Western blot analysis showed that mouse Lnk is actually a 68- kD protein

[0940] It is appreciated that the abovementioned animal model for LNK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[0941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0942] Li, Y.; He, X.; Schembri- King, J.; Jakes, S.; Hayashi, J. : Cloning and characterization of human Lnk, an adaptor protein with pleckstrin homology and Src homology 2 domains that can inhibit T cell activation. J. Immun. 164: 5199- 5206, 2000. ; and

[0943] Takaki, S.; Sauer, K.; Iritani, B. M.; Chien, S.; Ebihara, Y.; Tsuji, K.; Takatsu, K.; Perlmutter, R. M. : Control of B cell production by the adaptor protein Lnk: definition of a conserve.

[0944] Further studies establishing the function and utilities of LNK are found in John Hopkins OMIM database record ID 605093, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC112817 (Accession NP_612422.2) is another GAM25 target gene, herein designated TARGET GENE. LOC112817 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC112817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC112817 BINDING SITE, designated SEQ ID:19177, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0945] Another function of GAM25 is therefore inhibition of LOC112817 (Accession NP_612422.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112817.

[0946] LOC113444 (Accession NP_612437.2) is another GAM25 target gene, herein designated TARGET GENE. LOC113444 BINDING SITE1 and LOC113444 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC113444, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC113444 BINDING SITE1 and LOC113444 BINDING SITE2, designated SEQ ID:4156 and SEQ ID:7668 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0947] Another function of GAM25 is therefore inhibition of LOC113444 (Accession NP_612437.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113444.

[0948] LOC115098 (Accession NP_612451.1) is another GAM25 target gene, herein designated TARGET GENE. LOC115098 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC115098, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC115098 BINDING SITE, designated SEQ ID:5447, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0949] Another function of GAM25 is therefore inhibition of LOC115098 (Accession NP_612451.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115098.

[0950] LOC115219 (Accession XP_055499.2) is another GAM25 target gene, herein designated TARGET GENE. LOC115219 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC115219, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115219 BINDING SITE, designated SEQ ID:19046, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0951] Another function of GAM25 is therefore inhibition of LOC115219 (Accession XP_055499.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC115219.

[0952] LOC115648 (Accession NP_663299.1) is another GAM25 target gene, herein designated TARGET GENE. LOC115648 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115648, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115648 BINDING SITE, designated SEQ ID:6718, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0953] Another function of GAM25 is therefore inhibition of LOC115648 (Accession NP_663299.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115648.

[0954] LOC118490 (Accession XP_060981.3) is another GAM25 target gene, herein designated TARGET GENE. LOC118490 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC118490, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC118490 BINDING SITE, designated SEQ ID:1129, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0955] Another function of GAM25 is therefore inhibition of LOC118490 (Accession XP_060981.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118490.

[0956] LOC120526 (Accession XP_058475.1) is another GAM25 target gene, herein designated TARGET GENE. LOC120526 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC120526, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC120526 BINDING SITE, designated SEQ ID:5254, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0957] Another function of GAM25 is therefore inhibition of LOC120526 (Accession XP_058475.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120526.

[0958] LOC125061 (Accession XP_058889.3) is another GAM25 target gene, herein designated TARGET GENE. LOC125061 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC125061, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC125061 BINDING SITE, designated SEQ ID:13505, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0959] Another function of GAM25 is therefore inhibition of LOC125061 (Accession XP_058889.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125061.

[0960] LOC126669 (Accession XP_060121.4) is another GAM25 target gene, herein designated TARGET GENE. LOC126669 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:5257, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0961] Another function of GAM25 is therefore inhibition of LOC126669 (Accession XP_060121.4) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669.

[0962] LOC132241 (Accession XP_059583.1) is another GAM25 target gene, herein designated TARGET GENE. LOC132241 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC132241, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132241 BINDING SITE, designated SEQ ID:7296, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0963] Another function of GAM25 is therefore inhibition of LOC132241 (Accession XP_059583.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132241.

[0964] LOC135293 (Accession XP_072402.4) is another GAM25

target gene, herein designated TARGET GENE. LOC135293 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135293, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:19636, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0965] Another function of GAM25 is therefore inhibition of LOC135293 (Accession XP_072402.4) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293.

[0966] LOC135763 (Accession NP_612639.1) is another GAM25 target gene, herein designated TARGET GENE. LOC135763 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135763, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:11364, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[0967] Another function of GAM25 is therefore inhibition of LOC135763 (Accession NP_612639.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135763.

[0968] LOC144481 (Accession XP_096611.2) is another GAM25 target gene, herein designated TARGET GENE. LOC144481 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144481, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144481 BINDING SITE, designated SEQ ID:6245, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0969] Another function of GAM25 is therefore inhibition of LOC144481 (Accession XP_096611.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144481.

[0970] LOC144871 (Accession XP_096698.1) is another GAM25 target gene, herein designated TARGET GENE. LOC144871

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144871, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:2317, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0971] Another function of GAM25 is therefore inhibition of LOC144871 (Accession XP_096698.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871.

[0972] LOC145268 (Accession XP_085072.1) is another GAM25 target gene, herein designated TARGET GENE. LOC145268 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145268 BINDING SITE, designated SEQ ID:1754, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0973] Another function of GAM25 is therefore inhibition of LOC145268 (Accession XP_085072.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145268.

[0974] LOC145800 (Accession XP_085242.1) is another GAM25 target gene, herein designated TARGET GENE. LOC145800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145800 BINDING SITE, designated SEQ ID:2677, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0975] Another function of GAM25 is therefore inhibition of LOC145800 (Accession XP_085242.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145800.

[0976] LOC145813 (Accession XP_096873.1) is another GAM25 target gene, herein designated TARGET GENE. LOC145813 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC145813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145813 BINDING SITE, designated SEQ ID:634, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0977] Another function of GAM25 is therefore inhibition of LOC145813 (Accession XP_096873.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145813.

[0978] LOC146177 (Accession NP_778229.1) is another GAM25 target gene, herein designated TARGET GENE. LOC146177 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146177 BINDING SITE, designated SEQ ID:4315, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0979] Another function of GAM25 is therefore inhibition of

LOC146177 (Accession NP_778229.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146177.

[0980] LOC146229 (Accession XP_085387.1) is another GAM25 target gene, herein designated TARGET GENE. LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC146229, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2, designated SEQ ID:6069 and SEQ ID:11151 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0981] Another function of GAM25 is therefore inhibition of LOC146229 (Accession XP_085387.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229.

[0982] LOC146346 (Accession XP_085430.1) is another GAM25 target gene, herein designated TARGET GENE. LOC146346

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146346 BINDING SITE, designated SEQ ID:15193, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0983] Another function of GAM25 is therefore inhibition of LOC146346 (Accession XP_085430.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146346.

[0984] LOC146429 (Accession XP_096998.2) is another GAM25 target gene, herein designated TARGET GENE. LOC146429 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146429, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146429 BINDING SITE, designated SEQ ID:11432, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0985] Another function of GAM25 is therefore inhibition of LOC146429 (Accession XP_096998.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146429.

[0986] LOC146784 (Accession XP_085588.1) is another GAM25 target gene, herein designated TARGET GENE. LOC146784 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146784 BINDING SITE, designated SEQ ID:14301, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0987] Another function of GAM25 is therefore inhibition of LOC146784 (Accession XP_085588.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784.

[0988] LOC146820 (Accession XP_085603.1) is another GAM25 target gene, herein designated TARGET GENE. LOC146820 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC146820, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146820 BINDING SITE, designated SEQ ID:4887, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0989] Another function of GAM25 is therefore inhibition of LOC146820 (Accession XP_085603.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146820.

[0990] LOC146894 (Accession NP_660316.1) is another GAM25 target gene, herein designated TARGET GENE. LOC146894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:14231, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0991] Another function of GAM25 is therefore inhibition of

LOC146894 (Accession NP_660316.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894.

[0992] LOC146909 (Accession XP_085634.2) is another GAM25 target gene, herein designated TARGET GENE. LOC146909 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:18521, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0993] Another function of GAM25 is therefore inhibition of LOC146909 (Accession XP_085634.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909.

[0994] LOC147166 (Accession XP_085722.2) is another GAM25 target gene, herein designated TARGET GENE. LOC147166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147166, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147166 BINDING SITE, designated SEQ ID:1828, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0995] Another function of GAM25 is therefore inhibition of LOC147166 (Accession XP_085722.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147166.

[0996] LOC147817 (Accession XP_085903.1) is another GAM25 target gene, herein designated TARGET GENE. LOC147817 BINDING SITE1 and LOC147817 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC147817, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE1 and LOC147817 BINDING SITE2, designated SEQ ID:13127 and SEQ ID:20074 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0997] Another function of GAM25 is therefore inhibition of LOC147817 (Accession XP_085903.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817.

[0998] LOC147841 (Accession XP_085924.2) is another GAM25 target gene, herein designated TARGET GENE. LOC147841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147841 BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[0999] Another function of GAM25 is therefore inhibition of LOC147841 (Accession XP_085924.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147841.

[1000] LOC148137 (Accession NP_653293.1) is another GAM25 target gene, herein designated TARGET GENE. LOC148137 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC148137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1001] Another function of GAM25 is therefore inhibition of LOC148137 (Accession NP_653293.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137.

[1002] LOC148189 (Accession XP_086087.1) is another GAM25 target gene, herein designated TARGET GENE. LOC148189 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148189, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:4479, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1003] Another function of GAM25 is therefore inhibition of

LOC148189 (Accession XP_086087.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148189.

[1004] LOC148203 (Accession XP_086095.1) is another GAM25 target gene, herein designated TARGET GENE. LOC148203 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148203, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148203 BINDING SITE, designated SEQ ID:16166, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1005] Another function of GAM25 is therefore inhibition of LOC148203 (Accession XP_086095.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148203.

[1006] LOC148709 (Accession XP_086281.1) is another GAM25 target gene, herein designated TARGET GENE. LOC148709 BINDING SITE1 and LOC148709 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by LOC148709, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE1 and LOC148709 BINDING SITE2, designated SEQ ID:11549 and SEQ ID:18101 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1007] Another function of GAM25 is therefore inhibition of LOC148709 (Accession XP_086281.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709.

[1008] LOC149149 (Accession XP_097598.1) is another GAM25 target gene, herein designated TARGET GENE. LOC149149 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149149 BINDING SITE, designated SEQ ID:16301, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1009] Another function of GAM25 is therefore inhibition of LOC149149 (Accession XP_097598.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149149.

[1010] LOC149466 (Accession XP_086546.1) is another GAM25 target gene, herein designated TARGET GENE. LOC149466 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149466 BINDING SITE, designated SEQ ID:3185, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1011] Another function of GAM25 is therefore inhibition of LOC149466 (Accession XP_086546.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149466.

[1012] LOC149478 (Accession XP_086536.1) is another GAM25 target gene, herein designated TARGET GENE. LOC149478 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC149478, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:18212, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1013] Another function of GAM25 is therefore inhibition of LOC149478 (Accession XP_086536.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478.

[1014] LOC149506 (Accession XP_097661.1) is another GAM25 target gene, herein designated TARGET GENE. LOC149506 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:14533, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1015] Another function of GAM25 is therefore inhibition of

LOC149506 (Accession XP_097661.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506.

[1016] LOC150054 (Accession XP_097797.1) is another GAM25 target gene, herein designated TARGET GENE. LOC150054 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150054, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:9448, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1017] Another function of GAM25 is therefore inhibition of LOC150054 (Accession XP_097797.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054.

[1018] LOC150397 (Accession XP_086907.1) is another GAM25 target gene, herein designated TARGET GENE. LOC150397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150397, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1019] Another function of GAM25 is therefore inhibition of LOC150397 (Accession XP_086907.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397.

[1020] LOC150587 (Accession XP_097917.1) is another GAM25 target gene, herein designated TARGET GENE. LOC150587 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150587, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150587 BINDING SITE, designated SEQ ID:19636, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1021] Another function of GAM25 is therefore inhibition of LOC150587 (Accession XP_097917.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150587.

[1022] LOC150886 (Accession XP_097963.1) is another GAM25 target gene, herein designated TARGET GENE. LOC150886 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150886, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150886 BINDING SITE, designated SEQ ID:7130, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1023] Another function of GAM25 is therefore inhibition of LOC150886 (Accession XP_097963.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150886.

[1024] LOC151201 (Accession XP_098021.1) is another GAM25 target gene, herein designated TARGET GENE. LOC151201 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151201, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:9269, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1025] Another function of GAM25 is therefore inhibition of LOC151201 (Accession XP_098021.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201.

[1026] LOC151475 (Accession XP_098063.1) is another GAM25 target gene, herein designated TARGET GENE. LOC151475 BINDING SITE1 and LOC151475 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC151475, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE1 and LOC151475 BINDING SITE2, designated SEQ ID:14301 and SEQ ID:4882 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1027] Another function of GAM25 is therefore inhibition of

LOC151475 (Accession XP_098063.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475.

[1028] LOC151636 (Accession NP_612144.1) is another GAM25 target gene, herein designated TARGET GENE. LOC151636 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151636, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151636 BINDING SITE, designated SEQ ID:17818, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1029] Another function of GAM25 is therefore inhibition of LOC151636 (Accession NP_612144.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151636.

[1030] LOC152445 (Accession XP_098231.1) is another GAM25 target gene, herein designated TARGET GENE. LOC152445 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152445, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1031] Another function of GAM25 is therefore inhibition of LOC152445 (Accession XP_098231.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445.

[1032] LOC152620 (Accession XP_011108.2) is another GAM25 target gene, herein designated TARGET GENE. LOC152620 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152620, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152620 BINDING SITE, designated SEQ ID:3060, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1033] Another function of GAM25 is therefore inhibition of LOC152620 (Accession XP_011108.2) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152620.

[1034] LOC152667 (Accession XP_087500.1) is another GAM25 target gene, herein designated TARGET GENE. LOC152667 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152667, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152667 BINDING SITE, designated SEQ ID:4383, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1035] Another function of GAM25 is therefore inhibition of LOC152667 (Accession XP_087500.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152667.

[1036] LOC152719 (Accession XP_098257.1) is another GAM25 target gene, herein designated TARGET GENE. LOC152719 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152719, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152719 BINDING SITE, designated SEQ ID:12540, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1037] Another function of GAM25 is therefore inhibition of LOC152719 (Accession XP_098257.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152719.

[1038] LOC153077 (Accession XP_098307.1) is another GAM25 target gene, herein designated TARGET GENE. LOC153077 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:16720, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1039] Another function of GAM25 is therefore inhibition of LOC153077 (Accession XP_098307.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153077.

[1040] LOC153684 (Accession XP_098412.1) is another GAM25 target gene, herein designated TARGET GENE. LOC153684 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153684, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153684 BINDING SITE, designated SEQ ID:14611, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1041] Another function of GAM25 is therefore inhibition of LOC153684 (Accession XP_098412.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153684.

[1042] LOC154282 (Accession XP_098505.1) is another GAM25 target gene, herein designated TARGET GENE. LOC154282 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC154282, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:16702, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1043] Another function of GAM25 is therefore inhibition of LOC154282 (Accession XP_098505.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282.

[1044] LOC154822 (Accession XP_098618.3) is another GAM25 target gene, herein designated TARGET GENE. LOC154822 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC154822, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154822 BINDING SITE, designated SEQ ID:14064, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1045] Another function of GAM25 is therefore inhibition of LOC154822 (Accession XP_098618.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154822.

[1046] LOC154877 (Accession XP_098626.1) is another GAM25

target gene, herein designated TARGET GENE. LOC154877 BINDING SITE1 through LOC154877 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC154877, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE1 through LOC154877 BINDING SITE3, designated SEQ ID:11691, SEQ ID:13635 and SEQ ID:13046 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1047] Another function of GAM25 is therefore inhibition of LOC154877 (Accession XP_098626.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877.

[1048] LOC158014 (Accession XP_088442.1) is another GAM25 target gene, herein designated TARGET GENE. LOC158014 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158014, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC158014 BINDING SITE, designated SEQ ID:684, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1049] Another function of GAM25 is therefore inhibition of LOC158014 (Accession XP_088442.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014.

[1050] LOC158310 (Accession XP_098919.1) is another GAM25 target gene, herein designated TARGET GENE. LOC158310 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:19625, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1051] Another function of GAM25 is therefore inhibition of LOC158310 (Accession XP_098919.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310.

[1052] LOC158476 (Accession XP_098955.1) is another GAM25 target gene, herein designated TARGET GENE. LOC158476 BINDING SITE1 and LOC158476 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC158476, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE1 and LOC158476 BINDING SITE2, designated SEQ ID:18466 and SEQ ID:15086 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1053] Another function of GAM25 is therefore inhibition of LOC158476 (Accession XP_098955.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476.

[1054] LOC158865 (Accession XP_099000.1) is another GAM25 target gene, herein designated TARGET GENE. LOC158865 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC158865 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1055] Another function of GAM25 is therefore inhibition of LOC158865 (Accession XP_099000.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158865.

[1056] LOC161145 (Accession XP_101622.1) is another GAM25 target gene, herein designated TARGET GENE. LOC161145 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC161145, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC161145 BINDING SITE, designated SEQ ID:12540, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1057] Another function of GAM25 is therefore inhibition of LOC161145 (Accession XP_101622.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC161145.

[1058] LOC163227 (Accession NP_775802.1) is another GAM25 target gene, herein designated TARGET GENE. LOC163227 BINDING SITE1 and LOC163227 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC163227, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC163227 BINDING SITE1 and LOC163227 BINDING SITE2, designated SEQ ID:15025 and SEQ ID:1888 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1059] Another function of GAM25 is therefore inhibition of LOC163227 (Accession NP_775802.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163227.

[1060] LOC164091 (Accession XP_089356.1) is another GAM25 target gene, herein designated TARGET GENE. LOC164091 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC164091, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC164091 BINDING SITE, designated SEQ ID:8030, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1061] Another function of GAM25 is therefore inhibition of LOC164091 (Accession XP_089356.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164091.

[1062] LOC169611 (Accession XP_095809.4) is another GAM25 target gene, herein designated TARGET GENE. LOC169611 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC169611, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:17790, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1063] Another function of GAM25 is therefore inhibition of LOC169611 (Accession XP_095809.4) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC169611.

[1064] LOC196264 (Accession XP_113683.1) is another GAM25 target gene, herein designated TARGET GENE. LOC196264 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196264, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:5567, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1065] Another function of GAM25 is therefore inhibition of LOC196264 (Accession XP_113683.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264.

[1066] LOC196988 (Accession XP_113795.1) is another GAM25 target gene, herein designated TARGET GENE. LOC196988 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196988, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC196988 BINDING SITE, designated SEQ ID:2677, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1067] Another function of GAM25 is therefore inhibition of LOC196988 (Accession XP_113795.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196988.

[1068] LOC199906 (Accession XP_114052.1) is another GAM25 target gene, herein designated TARGET GENE. LOC199906 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199906 BINDING SITE, designated SEQ ID:9410, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1069] Another function of GAM25 is therefore inhibition of LOC199906 (Accession XP_114052.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199906.

[1070] LOC200169 (Accession XP_117200.1) is another GAM25 target gene, herein designated TARGET GENE. LOC200169 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC200169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200169 BINDING SITE, designated SEQ ID:5567, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1071] Another function of GAM25 is therefore inhibition of LOC200169 (Accession XP_117200.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200169.

[1072] LOC200860 (Accession XP_117289.1) is another GAM25 target gene, herein designated TARGET GENE. LOC200860 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200860, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:13127, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1073] Another function of GAM25 is therefore inhibition of LOC200860 (Accession XP_117289.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860.

[1074] LOC200895 (Accession NP_789785.1) is another GAM25 target gene, herein designated TARGET GENE. LOC200895 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200895, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200895 BINDING SITE, designated SEQ ID:3030, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1075] Another function of GAM25 is therefore inhibition of LOC200895 (Accession NP_789785.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200895.

[1076] LOC202460 (Accession XP_114493.1) is another GAM25 target gene, herein designated TARGET GENE. LOC202460 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC202460, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC202460 BINDING SITE, designated SEQ ID:12745, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1077] Another function of GAM25 is therefore inhibition of LOC202460 (Accession XP_114493.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202460.

[1078] LOC203547 (Accession XP_114719.1) is another GAM25 target gene, herein designated TARGET GENE. LOC203547 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC203547, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC203547 BINDING SITE, designated SEQ ID:18584, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1079] Another function of GAM25 is therefore inhibition of LOC203547 (Accession XP_114719.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203547.

[1080] LOC219293 (Accession XP_166599.2) is another GAM25 target gene, herein designated TARGET GENE. LOC219293 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219293, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219293 BINDING SITE, designated SEQ ID:4935, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1081] Another function of GAM25 is therefore inhibition of LOC219293 (Accession XP_166599.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219293.

[1082] LOC220074 (Accession NP_660352.1) is another GAM25 target gene, herein designated TARGET GENE. LOC220074 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220074, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220074 BINDING SITE, designated SEQ ID:2821, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1083] Another function of GAM25 is therefore inhibition of LOC220074 (Accession NP_660352.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220074.

[1084] LOC221091 (Accession XP_169026.1) is another GAM25 target gene, herein designated TARGET GENE. LOC221091 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221091, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221091 BINDING SITE, designated SEQ ID:1598, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1085] Another function of GAM25 is therefore inhibition of LOC221091 (Accession XP_169026.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221091.

[1086] LOC222031 (Accession XP_168371.1) is another GAM25 target gene, herein designated TARGET GENE. LOC222031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:1130, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1087] Another function of GAM25 is therefore inhibition of LOC222031 (Accession XP_168371.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031.

[1088] LOC222159 (Accession XP_212100.1) is another GAM25

target gene, herein designated TARGET GENE. LOC222159 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC222159, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222159 BINDING SITE, designated SEQ ID:12545, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1089] Another function of GAM25 is therefore inhibition of LOC222159 (Accession XP_212100.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222159.

[1090] LOC222224 (Accession XP_168473.1) is another GAM25 target gene, herein designated TARGET GENE. LOC222224 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC222224, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222224 BINDING SITE, designated SEQ ID:13949, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1091] Another function of GAM25 is therefore inhibition of LOC222224 (Accession XP_168473.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222224.

[1092] LOC252983 (Accession XP_170858.2) is another GAM25 target gene, herein designated TARGET GENE. LOC252983 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC252983, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC252983 BINDING SITE, designated SEQ ID:13976, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1093] Another function of GAM25 is therefore inhibition of LOC252983 (Accession XP_170858.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC252983.

[1094] LOC255177 (Accession XP_172941.1) is another GAM25

target gene, herein designated TARGET GENE. LOC255177 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:2252, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1095] Another function of GAM25 is therefore inhibition of LOC255177 (Accession XP_172941.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177.

[1096] LOC255458 (Accession XP_173150.1) is another GAM25 target gene, herein designated TARGET GENE. LOC255458 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255458, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255458 BINDING SITE, designated SEQ ID:15698, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1097] Another function of GAM25 is therefore inhibition of LOC255458 (Accession XP_173150.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255458.

[1098] LOC256614 (Accession XP_172864.1) is another GAM25 target gene, herein designated TARGET GENE. LOC256614 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256614, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256614 BINDING SITE, designated SEQ ID:16894, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1099] Another function of GAM25 is therefore inhibition of LOC256614 (Accession XP_172864.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256614.

[1100] LOC282997 (Accession XP_208473.1) is another GAM25 target gene, herein designated TARGET GENE. LOC282997

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282997, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282997 BINDING SITE, designated SEQ ID:17558, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1101] Another function of GAM25 is therefore inhibition of LOC282997 (Accession XP_208473.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282997.

[1102] LOC283031 (Accession XP_210859.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283031 BINDING SITE, designated SEQ ID:10453, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1103] Another function of GAM25 is therefore inhibition of LOC283031 (Accession XP_210859.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283031.

[1104] LOC283061 (Accession XP_210875.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283061 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283061, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283061 BINDING SITE, designated SEQ ID:18635, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1105] Another function of GAM25 is therefore inhibition of LOC283061 (Accession XP_210875.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283061.

[1106] LOC283089 (Accession XP_210885.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283089 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC283089, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283089 BINDING SITE, designated SEQ ID:1684, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1107] Another function of GAM25 is therefore inhibition of LOC283089 (Accession XP_210885.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283089.

[1108] LOC283119 (Accession XP_210895.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283119 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283119, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283119 BINDING SITE, designated SEQ ID:1051, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1109] Another function of GAM25 is therefore inhibition of

LOC283119 (Accession XP_210895.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283119.

[1110] LOC283241 (Accession NP_787089.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283241 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283241, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283241 BINDING SITE, designated SEQ ID:14301, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1111] Another function of GAM25 is therefore inhibition of LOC283241 (Accession NP_787089.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283241.

[1112] LOC283323 (Accession XP_210973.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283323 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283323, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283323 BINDING SITE, designated SEQ ID:14710, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1113] Another function of GAM25 is therefore inhibition of LOC283323 (Accession XP_210973.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283323.

[1114] LOC283335 (Accession XP_210981.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283335 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283335, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283335 BINDING SITE, designated SEQ ID:11355, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1115] Another function of GAM25 is therefore inhibition of LOC283335 (Accession XP_210981.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283335.

[1116] LOC283400 (Accession XP_211024.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283400 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283400, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283400 BINDING SITE, designated SEQ ID:10938, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1117] Another function of GAM25 is therefore inhibition of LOC283400 (Accession XP_211024.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283400.

[1118] LOC283454 (Accession XP_211049.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283454 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283454, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283454 BINDING SITE, designated SEQ ID:14301, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1119] Another function of GAM25 is therefore inhibition of LOC283454 (Accession XP_211049.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283454.

[1120] LOC283487 (Accession XP_211062.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283487 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC283487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283487 BINDING SITE, designated SEQ ID:3816, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1121] Another function of GAM25 is therefore inhibition of LOC283487 (Accession XP_211062.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283487.

[1122] LOC283507 (Accession XP_211075.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283507 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283507 BINDING SITE, designated SEQ ID:4772, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1123] Another function of GAM25 is therefore inhibition of LOC283507 (Accession XP_211075.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283507.

[1124] LOC283534 (Accession XP_211083.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283534 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283534, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283534 BINDING SITE, designated SEQ ID:13127, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1125] Another function of GAM25 is therefore inhibition of LOC283534 (Accession XP_211083.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283534.

[1126] LOC283551 (Accession XP_211110.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283551 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283551, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283551 BINDING SITE, designated SEQ ID:15674, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1127] Another function of GAM25 is therefore inhibition of LOC283551 (Accession XP_211110.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC283551.

[1128] LOC283575 (Accession XP_211095.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283575 BINDING SITE1 and LOC283575 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC283575, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283575 BINDING SITE1 and LOC283575 BINDING SITE2, designated SEQ ID:17611 and SEQ ID:16702 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1129] Another function of GAM25 is therefore inhibition of LOC283575 (Accession XP_211095.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283575.

[1130] LOC283590 (Accession XP_208741.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283590 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283590, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283590 BINDING SITE, designated SEQ ID:7310, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1131] Another function of GAM25 is therefore inhibition of LOC283590 (Accession XP_208741.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283590.

[1132] LOC283624 (Accession XP_211126.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283624 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283624, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283624 BINDING SITE, designated SEQ ID:15694, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1133] Another function of GAM25 is therefore inhibition of LOC283624 (Accession XP_211126.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283624.

[1134] LOC283641 (Accession XP_208764.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283641 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283641, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283641 BINDING SITE, designated SEQ ID:18297, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1135] Another function of GAM25 is therefore inhibition of LOC283641 (Accession XP_208764.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283641.

[1136] LOC283672 (Accession XP_211152.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283672 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283672, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283672 BINDING SITE, designated SEQ ID:14685, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1137] Another function of GAM25 is therefore inhibition of LOC283672 (Accession XP_211152.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283672.

[1138] LOC283767 (Accession XP_208835.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283767 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1139] Another function of GAM25 is therefore inhibition of LOC283767 (Accession XP_208835.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC283767.

[1140] LOC283857 (Accession XP_211236.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283857 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283857, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283857 BINDING SITE, designated SEQ ID:5363, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1141] Another function of GAM25 is therefore inhibition of LOC283857 (Accession XP_211236.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283857.

[1142] LOC283861 (Accession NP_787095.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283861 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283861, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC283861 BINDING SITE, designated SEQ ID:5363, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1143] Another function of GAM25 is therefore inhibition of LOC283861 (Accession NP_787095.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283861.

[1144] LOC283863 (Accession XP_208875.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283863 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283863, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283863 BINDING SITE, designated SEQ ID:10892, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1145] Another function of GAM25 is therefore inhibition of LOC283863 (Accession XP_208875.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC283863.

[1146] LOC283889 (Accession XP_208899.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283889 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283889 BINDING SITE, designated SEQ ID:5497, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1147] Another function of GAM25 is therefore inhibition of LOC283889 (Accession XP_208899.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283889.

[1148] LOC283928 (Accession XP_208909.1) is another GAM25 target gene, herein designated TARGET GENE. LOC283928 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283928, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283928 BINDING SITE, designated SEQ ID:13152, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1149] Another function of GAM25 is therefore inhibition of LOC283928 (Accession XP_208909.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283928.

[1150] LOC284001 (Accession XP_208958.2) is another GAM25 target gene, herein designated TARGET GENE. LOC284001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284001 BINDING SITE, designated SEQ ID:20163, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1151] Another function of GAM25 is therefore inhibition of LOC284001 (Accession XP_208958.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284001.

[1152] LOC284016 (Accession XP_211298.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284016 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284016, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284016 BINDING SITE, designated SEQ ID:13339, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1153] Another function of GAM25 is therefore inhibition of LOC284016 (Accession XP_211298.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284016.

[1154] LOC284023 (Accession XP_208983.3) is another GAM25 target gene, herein designated TARGET GENE. LOC284023 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284023, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284023 BINDING SITE, designated SEQ ID:12195, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1155] Another function of GAM25 is therefore inhibition of LOC284023 (Accession XP_208983.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284023.

[1156] LOC284039 (Accession XP_211312.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284039 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284039, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284039 BINDING SITE, designated SEQ ID:11517, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1157] Another function of GAM25 is therefore inhibition of LOC284039 (Accession XP_211312.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284039.

[1158] LOC284041 (Accession XP_211309.1) is another GAM25

target gene, herein designated TARGET GENE. LOC284041 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284041, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284041 BINDING SITE, designated SEQ ID:15667, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1159] Another function of GAM25 is therefore inhibition of LOC284041 (Accession XP_211309.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284041.

[1160] LOC284074 (Accession XP_211321.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284074 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284074, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284074 BINDING SITE, designated SEQ ID:15234, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1161] Another function of GAM25 is therefore inhibition of LOC284074 (Accession XP_211321.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284074.

[1162] LOC284095 (Accession XP_211324.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284095 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284095, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284095 BINDING SITE, designated SEQ ID:5191, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1163] Another function of GAM25 is therefore inhibition of LOC284095 (Accession XP_211324.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284095.

[1164] LOC284098 (Accession XP_209008.3) is another GAM25 target gene, herein designated TARGET GENE. LOC284098

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284098, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284098 BINDING SITE, designated SEQ ID:13505, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1165] Another function of GAM25 is therefore inhibition of LOC284098 (Accession XP_209008.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284098.

[1166] LOC284102 (Accession XP_211327.3) is another GAM25 target gene, herein designated TARGET GENE. LOC284102 BINDING SITE1 through LOC284102 BINDING SITE4 are target binding sites found in untranslated regions of mRNA encoded by LOC284102, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284102 BINDING SITE1 through LOC284102 BINDING SITE4, designated SEQ ID:18323, SEQ ID:18496, SEQ ID:18051 and

SEQ ID:5279 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1167] Another function of GAM25 is therefore inhibition of LOC284102 (Accession XP_211327.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284102.

[1168] LOC284135 (Accession XP_209032.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284135 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284135, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284135 BINDING SITE, designated SEQ ID:7936, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1169] Another function of GAM25 is therefore inhibition of LOC284135 (Accession XP_209032.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284135.

[1170] LOC284174 (Accession XP_211363.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284174 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284174 BINDING SITE, designated SEQ ID:5339, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1171] Another function of GAM25 is therefore inhibition of LOC284174 (Accession XP_211363.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284174.

[1172] LOC284183 (Accession XP_209059.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284183 BINDING SITE1 and LOC284183 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284183, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284183 BINDING SITE1

and LOC284183 BINDING SITE2, designated SEQ ID:19169 and SEQ ID:4426 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1173] Another function of GAM25 is therefore inhibition of LOC284183 (Accession XP_209059.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284183.

[1174] LOC284186 (Accession XP_209060.2) is another GAM25 target gene, herein designated TARGET GENE. LOC284186 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284186 BINDING SITE, designated SEQ ID:7709, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1175] Another function of GAM25 is therefore inhibition of LOC284186 (Accession XP_209060.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284186.

[1176] LOC284191 (Accession XP_211377.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284191 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284191, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284191 BINDING SITE, designated SEQ ID:18296, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1177] Another function of GAM25 is therefore inhibition of LOC284191 (Accession XP_211377.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284191.

[1178] LOC284260 (Accession XP_211408.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284260 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284260, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC284260 BINDING SITE, designated SEQ ID:5343, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1179] Another function of GAM25 is therefore inhibition of LOC284260 (Accession XP_211408.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284260.

[1180] LOC284276 (Accession XP_211412.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284276 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284276 BINDING SITE, designated SEQ ID:13505, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1181] Another function of GAM25 is therefore inhibition of LOC284276 (Accession XP_211412.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284276.

[1182] LOC284286 (Accession XP_211419.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284286 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284286 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1183] Another function of GAM25 is therefore inhibition of LOC284286 (Accession XP_211419.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284286.

[1184] LOC284311 (Accession XP_302720.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284311 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284311, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284311 BINDING SITE, designated SEQ ID:12209, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1185] Another function of GAM25 is therefore inhibition of LOC284311 (Accession XP_302720.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284311.

[1186] LOC284325 (Accession XP_209143.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284325 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284325, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284325 BINDING SITE, designated SEQ ID:13899, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1187] Another function of GAM25 is therefore inhibition of LOC284325 (Accession XP_209143.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284325.

[1188] LOC284362 (Accession XP_211435.1) is another GAM25

target gene, herein designated TARGET GENE. LOC284362 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284362, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284362 BINDING SITE, designated SEQ ID:19019, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1189] Another function of GAM25 is therefore inhibition of LOC284362 (Accession XP_211435.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284362.

[1190] LOC284376 (Accession XP_209157.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284376 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284376 BINDING SITE, designated SEQ ID:8491, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1191] Another function of GAM25 is therefore inhibition of LOC284376 (Accession XP_209157.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284376.

[1192] LOC284379 (Accession XP_209163.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284379 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284379, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284379 BINDING SITE, designated SEQ ID:1125, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1193] Another function of GAM25 is therefore inhibition of LOC284379 (Accession XP_209163.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284379.

[1194] LOC284421 (Accession XP_209200.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284421

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284421, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284421 BINDING SITE, designated SEQ ID:1637, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1195] Another function of GAM25 is therefore inhibition of LOC284421 (Accession XP_209200.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284421.

[1196] LOC284426 (Accession XP_209198.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284426 BINDING SITE1 through LOC284426 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC284426, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284426 BINDING SITE1 through LOC284426 BINDING SITE3, designated SEQ ID:4541, SEQ ID:4108 and SEQ ID:10929 re-

spectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1197] Another function of GAM25 is therefore inhibition of LOC284426 (Accession XP_209198.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284426.

[1198] LOC284454 (Accession XP_209216.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284454 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284454, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284454 BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1199] Another function of GAM25 is therefore inhibition of LOC284454 (Accession XP_209216.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284454.

[1200] LOC284551 (Accession XP_211515.1) is another GAM25

target gene, herein designated TARGET GENE. LOC284551 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284551, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284551 BINDING SITE, designated SEQ ID:18133, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1201] Another function of GAM25 is therefore inhibition of LOC284551 (Accession XP_211515.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284551.

[1202] LOC284628 (Accession XP_211561.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284628 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284628, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284628 BINDING SITE, designated SEQ ID:12373, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1203] Another function of GAM25 is therefore inhibition of LOC284628 (Accession XP_211561.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284628.

[1204] LOC284632 (Accession XP_211563.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284632 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284632, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284632 BINDING SITE, designated SEQ ID:10320, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1205] Another function of GAM25 is therefore inhibition of LOC284632 (Accession XP_211563.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284632.

[1206] LOC284646 (Accession XP_211573.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284646

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284646, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284646 BINDING SITE, designated SEQ ID:4131, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1207] Another function of GAM25 is therefore inhibition of LOC284646 (Accession XP_211573.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284646.

[1208] LOC284663 (Accession XP_209310.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284663 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284663 BINDING SITE, designated SEQ ID:3190, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1209] Another function of GAM25 is therefore inhibition of LOC284663 (Accession XP_209310.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284663.

[1210] LOC284723 (Accession XP_211602.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284723 BINDING SITE1 and LOC284723 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284723, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284723 BINDING SITE1 and LOC284723 BINDING SITE2, designated SEQ ID:5347 and SEQ ID:13127 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1211] Another function of GAM25 is therefore inhibition of LOC284723 (Accession XP_211602.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284723.

[1212] LOC284805 (Accession XP_209371.1) is another GAM25

target gene, herein designated TARGET GENE. LOC284805 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284805 BINDING SITE, designated SEQ ID:12293, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1213] Another function of GAM25 is therefore inhibition of LOC284805 (Accession XP_209371.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284805.

[1214] LOC284853 (Accession XP_209383.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284853 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284853, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284853 BINDING SITE, designated SEQ ID:15964, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1215] Another function of GAM25 is therefore inhibition of LOC284853 (Accession XP_209383.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284853.

[1216] LOC284856 (Accession XP_302835.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284856 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC284856, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284856 BINDING SITE, designated SEQ ID:15861, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1217] Another function of GAM25 is therefore inhibition of LOC284856 (Accession XP_302835.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284856.

[1218] LOC284856 (Accession XP_211668.2) is another GAM25

target gene, herein designated TARGET GENE. LOC284856 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC284856, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284856 BINDING SITE, designated SEQ ID:15861, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1219] Another function of GAM25 is therefore inhibition of LOC284856 (Accession XP_211668.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284856.

[1220] LOC284865 (Accession XP_211672.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284865 BINDING SITE, designated SEQ ID:16384, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1221] Another function of GAM25 is therefore inhibition of LOC284865 (Accession XP_211672.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284865.

[1222] LOC284934 (Accession XP_211696.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284934 BINDING SITE1 and LOC284934 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284934, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284934 BINDING SITE1 and LOC284934 BINDING SITE2, designated SEQ ID:2551 and SEQ ID:11777 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1223] Another function of GAM25 is therefore inhibition of LOC284934 (Accession XP_211696.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284934.

[1224] LOC284950 (Accession XP_211703.1) is another GAM25 target gene, herein designated TARGET GENE. LOC284950 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284950, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284950 BINDING SITE, designated SEQ ID:3185, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1225] Another function of GAM25 is therefore inhibition of LOC284950 (Accession XP_211703.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284950.

[1226] LOC285002 (Accession XP_211731.2) is another GAM25 target gene, herein designated TARGET GENE. LOC285002 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285002 BINDING SITE, designated SEQ ID:11586, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1227] Another function of GAM25 is therefore inhibition of LOC285002 (Accession XP_211731.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285002.

[1228] LOC285026 (Accession XP_209440.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285026 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285026, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285026 BINDING SITE, designated SEQ ID:13592, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1229] Another function of GAM25 is therefore inhibition of LOC285026 (Accession XP_209440.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285026.

[1230] LOC285033 (Accession XP_211739.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285033 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285033, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285033 BINDING SITE, designated SEQ ID:20139, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1231] Another function of GAM25 is therefore inhibition of LOC285033 (Accession XP_211739.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285033.

[1232] LOC285088 (Accession XP_209465.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285088 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285088, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285088 BINDING SITE, designated SEQ ID:12540, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1233] Another function of GAM25 is therefore inhibition of LOC285088 (Accession XP_209465.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285088.

[1234] LOC285127 (Accession XP_211771.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285127 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285127, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285127 BINDING SITE, designated SEQ ID:14649, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1235] Another function of GAM25 is therefore inhibition of LOC285127 (Accession XP_211771.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285127.

[1236] LOC285136 (Accession XP_211777.1) is another GAM25

target gene, herein designated TARGET GENE. LOC285136 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285136 BINDING SITE, designated SEQ ID:3517, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1237] Another function of GAM25 is therefore inhibition of LOC285136 (Accession XP_211777.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285136.

[1238] LOC285299 (Accession XP_209554.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285299 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285299, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285299 BINDING SITE, designated SEQ ID:2421, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1239] Another function of GAM25 is therefore inhibition of LOC285299 (Accession XP_209554.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285299.

[1240] LOC285334 (Accession XP_211844.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285334 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285334, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285334 BINDING SITE, designated SEQ ID:9968, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1241] Another function of GAM25 is therefore inhibition of LOC285334 (Accession XP_211844.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285334.

[1242] LOC285344 (Accession XP_211853.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285344

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285344, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285344 BINDING SITE, designated SEQ ID:14925, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1243] Another function of GAM25 is therefore inhibition of LOC285344 (Accession XP_211853.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285344.

[1244] LOC285345 (Accession XP_211854.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285345 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285345, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285345 BINDING SITE, designated SEQ ID:1100, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1245] Another function of GAM25 is therefore inhibition of LOC285345 (Accession XP_211854.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285345.

[1246] LOC285398 (Accession XP_209593.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285398 BINDING SITE1 and LOC285398 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285398, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285398 BINDING SITE1 and LOC285398 BINDING SITE2, designated SEQ ID:17312 and SEQ ID:2929 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1247] Another function of GAM25 is therefore inhibition of LOC285398 (Accession XP_209593.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285398.

[1248] LOC285510 (Accession XP_209643.1) is another GAM25

target gene, herein designated TARGET GENE. LOC285510 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285510, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285510 BINDING SITE, designated SEQ ID:1520, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1249] Another function of GAM25 is therefore inhibition of LOC285510 (Accession XP_209643.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285510.

[1250] LOC285533 (Accession NP_775933.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285533 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285533, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285533 BINDING SITE, designated SEQ ID:13006, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1251] Another function of GAM25 is therefore inhibition of LOC285533 (Accession NP_775933.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285533.

[1252] LOC285589 (Accession XP_209671.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285589 BINDING SITE1 and LOC285589 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285589, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285589 BINDING SITE1 and LOC285589 BINDING SITE2, designated SEQ ID:8906 and SEQ ID:16135 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1253] Another function of GAM25 is therefore inhibition of LOC285589 (Accession XP_209671.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285589.

[1254] LOC285626 (Accession XP_211959.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285626 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285626, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285626 BINDING SITE, designated SEQ ID:9340, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1255] Another function of GAM25 is therefore inhibition of LOC285626 (Accession XP_211959.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285626.

[1256] LOC285683 (Accession XP_211980.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285683 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285683, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285683 BINDING SITE, designated SEQ ID:4038, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1257] Another function of GAM25 is therefore inhibition of LOC285683 (Accession XP_211980.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285683.

[1258] LOC285689 (Accession XP_209724.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285689 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285689, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285689 BINDING SITE, designated SEQ ID:12373, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1259] Another function of GAM25 is therefore inhibition of LOC285689 (Accession XP_209724.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285689.

[1260] LOC285744 (Accession XP_209743.1) is another GAM25

target gene, herein designated TARGET GENE. LOC285744 BINDING SITE1 and LOC285744 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285744, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285744 BINDING SITE1 and LOC285744 BINDING SITE2, designated SEQ ID:18188 and SEQ ID:13900 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1261] Another function of GAM25 is therefore inhibition of LOC285744 (Accession XP_209743.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285744.

[1262] LOC285760 (Accession XP_209750.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285760 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285760, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285760 BINDING SITE, designated SEQ ID:8007, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1263] Another function of GAM25 is therefore inhibition of LOC285760 (Accession XP_209750.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285760.

[1264] LOC285768 (Accession XP_212017.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285768 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285768 BINDING SITE, designated SEQ ID:15725, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1265] Another function of GAM25 is therefore inhibition of LOC285768 (Accession XP_212017.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285768.

[1266] LOC285812 (Accession XP_212055.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285812 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285812 BINDING SITE, designated SEQ ID:6449, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1267] Another function of GAM25 is therefore inhibition of LOC285812 (Accession XP_212055.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285812.

[1268] LOC285813 (Accession XP_212036.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285813 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285813 BINDING SITE, designated SEQ ID:7686, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1269] Another function of GAM25 is therefore inhibition of LOC285813 (Accession XP_212036.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285813.

[1270] LOC285822 (Accession XP_209777.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285822 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285822, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285822 BINDING SITE, designated SEQ ID:7527, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1271] Another function of GAM25 is therefore inhibition of LOC285822 (Accession XP_209777.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285822.

[1272] LOC285843 (Accession XP_212034.1) is another GAM25

target gene, herein designated TARGET GENE. LOC285843 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285843, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285843 BINDING SITE, designated SEQ ID:11310, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1273] Another function of GAM25 is therefore inhibition of LOC285843 (Accession XP_212034.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285843.

[1274] LOC285853 (Accession XP_209779.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285853 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285853, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285853 BINDING SITE, designated SEQ ID:4561, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1275] Another function of GAM25 is therefore inhibition of LOC285853 (Accession XP_209779.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285853.

[1276] LOC285896 (Accession XP_209806.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285896 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285896, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285896 BINDING SITE, designated SEQ ID:9727, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1277] Another function of GAM25 is therefore inhibition of LOC285896 (Accession XP_209806.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285896.

[1278] LOC285923 (Accession XP_212104.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285923

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285923, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285923 BINDING SITE, designated SEQ ID:951, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1279] Another function of GAM25 is therefore inhibition of LOC285923 (Accession XP_212104.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285923.

[1280] LOC285930 (Accession XP_209818.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285930 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285930, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285930 BINDING SITE, designated SEQ ID:12786, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1281] Another function of GAM25 is therefore inhibition of LOC285930 (Accession XP_209818.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285930.

[1282] LOC285972 (Accession XP_212105.1) is another GAM25 target gene, herein designated TARGET GENE. LOC285972 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285972, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285972 BINDING SITE, designated SEQ ID:20178, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1283] Another function of GAM25 is therefore inhibition of LOC285972 (Accession XP_212105.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285972.

[1284] LOC286007 (Accession XP_212133.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286007 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC286007, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286007 BINDING SITE, designated SEQ ID:8978, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1285] Another function of GAM25 is therefore inhibition of LOC286007 (Accession XP_212133.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286007.

[1286] LOC286078 (Accession XP_212163.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286078 BINDING SITE1 and LOC286078 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC286078, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286078 BINDING SITE1 and LOC286078 BINDING SITE2, designated SEQ ID:1126 and SEQ ID:11384 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also

designated SEQ ID:206.

[1287] Another function of GAM25 is therefore inhibition of LOC286078 (Accession XP_212163.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286078.

[1288] LOC286090 (Accession XP_212166.3) is another GAM25 target gene, herein designated TARGET GENE. LOC286090 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286090, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286090 BINDING SITE, designated SEQ ID:6502, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1289] Another function of GAM25 is therefore inhibition of LOC286090 (Accession XP_212166.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286090.

[1290] LOC286108 (Accession XP_212175.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286108

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286108, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286108 BINDING SITE, designated SEQ ID:9054, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1291] Another function of GAM25 is therefore inhibition of LOC286108 (Accession XP_212175.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286108.

[1292] LOC286208 (Accession XP_212230.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286208 BINDING SITE1 through LOC286208 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC286208, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286208 BINDING SITE1 through LOC286208 BINDING SITE3, designated SEQ ID:2802, SEQ ID:4183 and SEQ ID:16198 re-

spectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1293] Another function of GAM25 is therefore inhibition of LOC286208 (Accession XP_212230.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286208.

[1294] LOC286215 (Accession XP_212228.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286215 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286215, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286215 BINDING SITE, designated SEQ ID:18265, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1295] Another function of GAM25 is therefore inhibition of LOC286215 (Accession XP_212228.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286215.

[1296] LOC286341 (Accession XP_212278.1) is another GAM25

target gene, herein designated TARGET GENE. LOC286341 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286341, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286341 BINDING SITE, designated SEQ ID:12540, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1297] Another function of GAM25 is therefore inhibition of LOC286341 (Accession XP_212278.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286341.

[1298] LOC286381 (Accession XP_212298.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286381 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286381, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286381 BINDING SITE, designated SEQ ID:18747, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1299] Another function of GAM25 is therefore inhibition of LOC286381 (Accession XP_212298.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286381.

[1300] LOC286401 (Accession XP_212310.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286401 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286401, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286401 BINDING SITE, designated SEQ ID:7029, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1301] Another function of GAM25 is therefore inhibition of LOC286401 (Accession XP_212310.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286401.

[1302] LOC286435 (Accession XP_210047.1) is another GAM25 target gene, herein designated TARGET GENE. LOC286435

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286435 BINDING SITE, designated SEQ ID:18922, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1303] Another function of GAM25 is therefore inhibition of LOC286435 (Accession XP_210047.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286435.

[1304] LOC338562 (Accession XP_294654.1) is another GAM25 target gene, herein designated TARGET GENE. LOC338562 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338562 BINDING SITE, designated SEQ ID:9042, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1305] Another function of GAM25 is therefore inhibition of LOC338562 (Accession XP_294654.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338562.

[1306] LOC338773 (Accession XP_290570.1) is another GAM25 target gene, herein designated TARGET GENE. LOC338773 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338773, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338773 BINDING SITE, designated SEQ ID:8986, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1307] Another function of GAM25 is therefore inhibition of LOC338773 (Accession XP_290570.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338773.

[1308] LOC338841 (Accession XP_290597.1) is another GAM25 target gene, herein designated TARGET GENE. LOC338841 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC338841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338841 BINDING SITE, designated SEQ ID:3313, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1309] Another function of GAM25 is therefore inhibition of LOC338841 (Accession XP_290597.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338841.

[1310] LOC338899 (Accession XP_294740.1) is another GAM25 target gene, herein designated TARGET GENE. LOC338899 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338899, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338899 BINDING SITE, designated SEQ ID:7214, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1311] Another function of GAM25 is therefore inhibition of

LOC338899 (Accession XP_294740.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338899.

[1312] LOC338923 (Accession XP_294742.1) is another GAM25 target gene, herein designated TARGET GENE. LOC338923 BINDING SITE1 and LOC338923 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC338923, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338923 BINDING SITE1 and LOC338923 BINDING SITE2, designated SEQ ID:14301 and SEQ ID:9654 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1313] Another function of GAM25 is therefore inhibition of LOC338923 (Accession XP_294742.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338923.

[1314] LOC338991 (Accession XP_290663.1) is another GAM25 target gene, herein designated TARGET GENE. LOC338991

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338991, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338991 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1315] Another function of GAM25 is therefore inhibition of LOC338991 (Accession XP_290663.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338991.

[1316] LOC338999 (Accession XP_290659.1) is another GAM25 target gene, herein designated TARGET GENE. LOC338999 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338999, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338999 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1317] Another function of GAM25 is therefore inhibition of LOC338999 (Accession XP_290659.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338999.

[1318] LOC339077 (Accession XP_294802.2) is another GAM25 target gene, herein designated TARGET GENE. LOC339077 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339077 BINDING SITE, designated SEQ ID:4804, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1319] Another function of GAM25 is therefore inhibition of LOC339077 (Accession XP_294802.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339077.

[1320] LOC339078 (Accession XP_290692.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339078 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC339078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339078 BINDING SITE, designated SEQ ID:7452, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1321] Another function of GAM25 is therefore inhibition of LOC339078 (Accession XP_290692.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339078.

[1322] LOC339146 (Accession XP_294825.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339146 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339146 BINDING SITE, designated SEQ ID:9303, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1323] Another function of GAM25 is therefore inhibition of

LOC339146 (Accession XP_294825.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339146.

[1324] LOC339178 (Accession XP_290742.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339178 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339178, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339178 BINDING SITE, designated SEQ ID:12883, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1325] Another function of GAM25 is therefore inhibition of LOC339178 (Accession XP_290742.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339178.

[1326] LOC339283 (Accession XP_294899.2) is another GAM25 target gene, herein designated TARGET GENE. LOC339283 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339283, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339283 BINDING SITE, designated SEQ ID:13583, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1327] Another function of GAM25 is therefore inhibition of LOC339283 (Accession XP_294899.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339283.

[1328] LOC339448 (Accession XP_290902.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339448 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339448, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339448 BINDING SITE, designated SEQ ID:14390, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1329] Another function of GAM25 is therefore inhibition of LOC339448 (Accession XP_290902.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339448.

[1330] LOC339492 (Accession XP_290919.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339492 BINDING SITE1 and LOC339492 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC339492, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339492 BINDING SITE1 and LOC339492 BINDING SITE2, designated SEQ ID:14483 and SEQ ID:5531 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1331] Another function of GAM25 is therefore inhibition of LOC339492 (Accession XP_290919.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339492.

[1332] LOC339622 (Accession XP_295016.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339622 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC339622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339622 BINDING SITE, designated SEQ ID:12194, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1333] Another function of GAM25 is therefore inhibition of LOC339622 (Accession XP_295016.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339622.

[1334] LOC339659 (Accession XP_290981.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339659 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339659, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339659 BINDING SITE, designated SEQ ID:5829, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1335] Another function of GAM25 is therefore inhibition of

LOC339659 (Accession XP_290981.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339659.

[1336] LOC339694 (Accession XP_295035.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339694 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339694, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339694 BINDING SITE, designated SEQ ID:3727, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1337] Another function of GAM25 is therefore inhibition of LOC339694 (Accession XP_295035.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339694.

[1338] LOC339711 (Accession XP_295038.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339711 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339711, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339711 BINDING SITE, designated SEQ ID:13056, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1339] Another function of GAM25 is therefore inhibition of LOC339711 (Accession XP_295038.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339711.

[1340] LOC339813 (Accession XP_295074.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339813 BINDING SITE1 and LOC339813 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC339813, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339813 BINDING SITE1 and LOC339813 BINDING SITE2, designated SEQ ID:13017 and SEQ ID:1207 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1341] Another function of GAM25 is therefore inhibition of LOC339813 (Accession XP_295074.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339813.

[1342] LOC339832 (Accession XP_295079.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339832 BINDING SITE1 and LOC339832 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC339832, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339832 BINDING SITE1 and LOC339832 BINDING SITE2, designated SEQ ID:7498 and SEQ ID:3980 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1343] Another function of GAM25 is therefore inhibition of LOC339832 (Accession XP_295079.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339832.

[1344] LOC339833 (Accession XP_291031.1) is another GAM25

target gene, herein designated TARGET GENE. LOC339833 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339833, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339833 BINDING SITE, designated SEQ ID:1624, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1345] Another function of GAM25 is therefore inhibition of LOC339833 (Accession XP_291031.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339833.

[1346] LOC339872 (Accession XP_291050.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339872 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339872, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339872 BINDING SITE, designated SEQ ID:1784, to the nucleotide sequence of GAM25 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:206.

[1347] Another function of GAM25 is therefore inhibition of LOC339872 (Accession XP_291050.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339872.

[1348] LOC339924 (Accession XP_295103.1) is another GAM25 target gene, herein designated TARGET GENE. LOC339924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339924 BINDING SITE, designated SEQ ID:6629, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1349] Another function of GAM25 is therefore inhibition of LOC339924 (Accession XP_295103.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339924.

[1350] LOC340037 (Accession XP_295137.1) is another GAM25 target gene, herein designated TARGET GENE. LOC340037

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340037, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340037 BINDING SITE, designated SEQ ID:1128, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1351] Another function of GAM25 is therefore inhibition of LOC340037 (Accession XP_295137.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340037.

[1352] LOC340138 (Accession XP_291153.1) is another GAM25 target gene, herein designated TARGET GENE. LOC340138 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340138, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340138 BINDING SITE, designated SEQ ID:18048, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1353] Another function of GAM25 is therefore inhibition of LOC340138 (Accession XP_291153.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340138.

[1354] LOC340156 (Accession XP_291158.1) is another GAM25 target gene, herein designated TARGET GENE. LOC340156 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340156 BINDING SITE, designated SEQ ID:5363, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1355] Another function of GAM25 is therefore inhibition of LOC340156 (Accession XP_291158.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340156.

[1356] LOC340249 (Accession XP_291211.1) is another GAM25 target gene, herein designated TARGET GENE. LOC340249 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC340249, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340249 BINDING SITE, designated SEQ ID:2255, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1357] Another function of GAM25 is therefore inhibition of LOC340249 (Accession XP_291211.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340249.

[1358] LOC340259 (Accession XP_295190.1) is another GAM25 target gene, herein designated TARGET GENE. LOC340259 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340259 BINDING SITE, designated SEQ ID:4561, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1359] Another function of GAM25 is therefore inhibition of

LOC340259 (Accession XP_295190.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340259.

[1360] LOC340414 (Accession XP_295240.1) is another GAM25 target gene, herein designated TARGET GENE. LOC340414 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340414, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340414 BINDING SITE, designated SEQ ID:11179, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1361] Another function of GAM25 is therefore inhibition of LOC340414 (Accession XP_295240.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340414.

[1362] LOC340547 (Accession XP_291331.1) is another GAM25 target gene, herein designated TARGET GENE. LOC340547 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340547, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340547 BINDING SITE, designated SEQ ID:15544, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1363] Another function of GAM25 is therefore inhibition of LOC340547 (Accession XP_291331.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340547.

[1364] LOC342926 (Accession XP_292790.2) is another GAM25 target gene, herein designated TARGET GENE. LOC342926 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC342926, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342926 BINDING SITE, designated SEQ ID:12088, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1365] Another function of GAM25 is therefore inhibition of LOC342926 (Accession XP_292790.2) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342926.

[1366] LOC346653 (Accession XP_294357.2) is another GAM25 target gene, herein designated TARGET GENE. LOC346653 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC346653, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC346653 BINDING SITE, designated SEQ ID:16571, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1367] Another function of GAM25 is therefore inhibition of LOC346653 (Accession XP_294357.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC346653.

[1368] LOC347882 (Accession XP_302618.1) is another GAM25 target gene, herein designated TARGET GENE. LOC347882 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347882, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347882 BINDING SITE, designated SEQ ID:3732, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1369] Another function of GAM25 is therefore inhibition of LOC347882 (Accession XP_302618.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347882.

[1370] LOC347918 (Accession XP_300565.1) is another GAM25 target gene, herein designated TARGET GENE. LOC347918 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347918, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347918 BINDING SITE, designated SEQ ID:5342, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1371] Another function of GAM25 is therefore inhibition of LOC347918 (Accession XP_300565.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC347918.

[1372] LOC348024 (Accession XP_300592.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348024 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348024 BINDING SITE, designated SEQ ID:19164, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1373] Another function of GAM25 is therefore inhibition of LOC348024 (Accession XP_300592.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348024.

[1374] LOC348094 (Accession XP_300615.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348094 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348094, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC348094 BINDING SITE, designated SEQ ID:14669, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1375] Another function of GAM25 is therefore inhibition of LOC348094 (Accession XP_300615.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348094.

[1376] LOC348113 (Accession XP_300623.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348113 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348113 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1377] Another function of GAM25 is therefore inhibition of LOC348113 (Accession XP_300623.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348113.

[1378] LOC348115 (Accession XP_300626.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348115 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348115 BINDING SITE, designated SEQ ID:5344, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1379] Another function of GAM25 is therefore inhibition of LOC348115 (Accession XP_300626.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348115.

[1380] LOC348137 (Accession XP_300635.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348137 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1381] Another function of GAM25 is therefore inhibition of LOC348137 (Accession XP_300635.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348137.

[1382] LOC348142 (Accession XP_300636.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348142 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1383] Another function of GAM25 is therefore inhibition of LOC348142 (Accession XP_300636.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348142.

[1384] LOC348235 (Accession XP_300670.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348235 BINDING SITE, designated SEQ ID:8807, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1385] Another function of GAM25 is therefore inhibition of LOC348235 (Accession XP_300670.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348235.

[1386] LOC348326 (Accession XP_300696.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348326 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348326, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348326 BINDING SITE, designated SEQ ID:4883, to

the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1387] Another function of GAM25 is therefore inhibition of LOC348326 (Accession XP_300696.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348326.

[1388] LOC348393 (Accession XP_302741.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348393 BINDING SITE1 and LOC348393 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348393, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348393 BINDING SITE1 and LOC348393 BINDING SITE2, designated SEQ ID:2896 and SEQ ID:4259 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1389] Another function of GAM25 is therefore inhibition of LOC348393 (Accession XP_302741.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348393.

[1390] LOC348396 (Accession XP_300729.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348396 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348396, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348396 BINDING SITE, designated SEQ ID:15782, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1391] Another function of GAM25 is therefore inhibition of LOC348396 (Accession XP_300729.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348396.

[1392] LOC348402 (Accession XP_300730.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348402 BINDING SITE1 and LOC348402 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348402, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of LOC348402 BINDING SITE1 and LOC348402 BINDING SITE2, designated SEQ ID:14483 and SEQ ID:5531 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1393] Another function of GAM25 is therefore inhibition of LOC348402 (Accession XP_300730.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348402.

[1394] LOC348428 (Accession XP_302753.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348428 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348428, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348428 BINDING SITE, designated SEQ ID:15122, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1395] Another function of GAM25 is therefore inhibition of LOC348428 (Accession XP_302753.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348428.

[1396] LOC348445 (Accession XP_300738.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348445 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348445, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348445 BINDING SITE, designated SEQ ID:4883, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1397] Another function of GAM25 is therefore inhibition of LOC348445 (Accession XP_300738.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348445.

[1398] LOC348503 (Accession XP_300762.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348503 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348503, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC348503 BINDING SITE, designated SEQ ID:4935, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1399] Another function of GAM25 is therefore inhibition of LOC348503 (Accession XP_300762.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348503.

[1400] LOC348532 (Accession XP_302818.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348532 BINDING SITE1 and LOC348532 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348532, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348532 BINDING SITE1 and LOC348532 BINDING SITE2, designated SEQ ID:2896 and SEQ ID:4259 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1401] Another function of GAM25 is therefore inhibition of LOC348532 (Accession XP_302818.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348532.

[1402] LOC348567 (Accession XP_300378.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348567 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348567, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348567 BINDING SITE, designated SEQ ID:12540, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1403] Another function of GAM25 is therefore inhibition of LOC348567 (Accession XP_300378.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348567.

[1404] LOC348583 (Accession XP_302833.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348583 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348583, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348583 BINDING SITE, designated SEQ ID:5363, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1405] Another function of GAM25 is therefore inhibition of LOC348583 (Accession XP_302833.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348583.

[1406] LOC348790 (Accession XP_300843.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348790 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348790, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348790 BINDING SITE, designated SEQ ID:9567, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1407] Another function of GAM25 is therefore inhibition of LOC348790 (Accession XP_300843.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348790.

[1408] LOC348798 (Accession XP_300845.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348798 BINDING SITE, designated SEQ ID:1441, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1409] Another function of GAM25 is therefore inhibition of LOC348798 (Accession XP_300845.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348798.

[1410] LOC348947 (Accession XP_302929.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348947 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348947, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC348947 BINDING SITE, designated SEQ ID:12770, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1411] Another function of GAM25 is therefore inhibition of LOC348947 (Accession XP_302929.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348947.

[1412] LOC348995 (Accession XP_300434.1) is another GAM25 target gene, herein designated TARGET GENE. LOC348995 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348995, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348995 BINDING SITE, designated SEQ ID:16135, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1413] Another function of GAM25 is therefore inhibition of LOC348995 (Accession XP_300434.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348995.

[1414] LOC349024 (Accession XP_300250.1) is another GAM25 target gene, herein designated TARGET GENE. LOC349024 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349024 BINDING SITE, designated SEQ ID:644, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1415] Another function of GAM25 is therefore inhibition of LOC349024 (Accession XP_300250.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349024.

[1416] LOC349075 (Accession XP_300932.1) is another GAM25 target gene, herein designated TARGET GENE. LOC349075 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349075, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC349075 BINDING SITE, designated SEQ ID:12101, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1417] Another function of GAM25 is therefore inhibition of LOC349075 (Accession XP_300932.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349075.

[1418] LOC349080 (Accession XP_302952.1) is another GAM25 target gene, herein designated TARGET GENE. LOC349080 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349080 BINDING SITE, designated SEQ ID:997, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1419] Another function of GAM25 is therefore inhibition of LOC349080 (Accession XP_302952.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349080.

[1420] LOC349170 (Accession XP_300969.1) is another GAM25 target gene, herein designated TARGET GENE. LOC349170 BINDING SITE1 and LOC349170 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC349170, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349170 BINDING SITE1 and LOC349170 BINDING SITE2, designated SEQ ID:4803 and SEQ ID:14563 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1421] Another function of GAM25 is therefore inhibition of LOC349170 (Accession XP_300969.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349170.

[1422] LOC349261 (Accession XP_300998.1) is another GAM25 target gene, herein designated TARGET GENE. LOC349261 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349261, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC349261 BINDING SITE, designated SEQ ID:18801, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1423] Another function of GAM25 is therefore inhibition of LOC349261 (Accession XP_300998.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349261.

[1424] LOC349360 (Accession XP_088528.1) is another GAM25 target gene, herein designated TARGET GENE. LOC349360 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349360, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349360 BINDING SITE, designated SEQ ID:17187, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1425] Another function of GAM25 is therefore inhibition of LOC349360 (Accession XP_088528.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC349360.

[1426] LOC349430 (Accession XP_301084.1) is another GAM25 target gene, herein designated TARGET GENE. LOC349430 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349430, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349430 BINDING SITE, designated SEQ ID:18922, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1427] Another function of GAM25 is therefore inhibition of LOC349430 (Accession XP_301084.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349430.

[1428] LOC51193 (Accession NP_057415.1) is another GAM25 target gene, herein designated TARGET GENE. LOC51193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC51193 BINDING SITE, designated SEQ ID:5306, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1429] Another function of GAM25 is therefore inhibition of LOC51193 (Accession NP_057415.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51193.

[1430] LOC57107 (Accession NP_065114.2) is another GAM25 target gene, herein designated TARGET GENE. LOC57107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:1130, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1431] Another function of GAM25 is therefore inhibition of LOC57107 (Accession NP_065114.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107.

[1432] LOC90408 (Accession XP_031517.1) is another GAM25 target gene, herein designated TARGET GENE. LOC90408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:16076, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1433] Another function of GAM25 is therefore inhibition of LOC90408 (Accession XP_031517.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408.

[1434] LOC90485 (Accession XP_032059.1) is another GAM25 target gene, herein designated TARGET GENE. LOC90485 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90485, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90485 BINDING SITE, designated SEQ ID:1125, to the

nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1435] Another function of GAM25 is therefore inhibition of LOC90485 (Accession XP_032059.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90485.

[1436] LOC91170 (Accession XP_036612.1) is another GAM25 target gene, herein designated TARGET GENE. LOC91170 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91170 BINDING SITE, designated SEQ ID:12009, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1437] Another function of GAM25 is therefore inhibition of LOC91170 (Accession XP_036612.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91170.

[1438] LOC91250 (Accession XP_037135.1) is another GAM25

target gene, herein designated TARGET GENE. LOC91250 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91250, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, designated SEQ ID:11626, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1439] Another function of GAM25 is therefore inhibition of LOC91250 (Accession XP_037135.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250.

[1440] LOC91663 (Accession NP_612382.1) is another GAM25 target gene, herein designated TARGET GENE. LOC91663 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91663 BINDING SITE, designated SEQ ID:10068, to the nucleotide sequence of GAM25 RNA, herein designated

GAM RNA, also designated SEQ ID:206.

[1441] Another function of GAM25 is therefore inhibition of LOC91663 (Accession NP_612382.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91663.

[1442] LOC93132 (Accession XP_049396.1) is another GAM25 target gene, herein designated TARGET GENE. LOC93132 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC93132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93132 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1443] Another function of GAM25 is therefore inhibition of LOC93132 (Accession XP_049396.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93132.

[1444] LOST1 (Accession NP_758955.1) is another GAM25 target gene, herein designated TARGET GENE. LOST1 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOST1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOST1 BINDING SITE, designated SEQ ID:1474, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1445] Another function of GAM25 is therefore inhibition of LOST1 (Accession NP_758955.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOST1.

[1446] Leukotriene b4 receptor (LTB4R, Accession NP_000743.1) is another GAM25 target gene, herein designated TARGET GENE. LTB4R BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LTB4R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTB4R BINDING SITE, designated SEQ ID:12498, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1447] Another function of GAM25 is therefore inhibition of

Leukotriene b4 receptor (LTB4R, Accession NP_000743.1), a gene which may be the cardiac p2y receptor involved in the regulation of cardiac muscle contraction through modulation of l- type calcium currents. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTB4R.

[1448] The function of LTB4R has been established by previous studies. Yokomizo et al. (1997) found that the putative purinoceptor P2Y7 has a primary structure identical to that of a BLTR clone, HL- 5. To determine whether BLTR also functions as a purinoceptor, they established stable transformants of BLTR in glioma cells that possess negligible amounts of intrinsic purinoceptors. In these cells, up to 300 microM caused no change in intracellular calcium levels, but significant increases in the calcium concentrations were induced by exposure to 10 nanoM LTB4. These results were interpreted to indicate that this receptor is not a purinoceptor, but a BLTR By genomic sequence analysis, Kato et al. (2000) determined that BLT1 lacks TATA and CAAT elements but possesses a GC- rich sequence in the promoter region. Luciferase reporter analysis showed that the region required for basal transcrip-

tion, which is activated by SP1, is about 80 bp upstream from the initiator sequence. Southern blot analysis revealed that the CpG sites of the BLT1 promoter are highly methylated in cells not expressing BLT1, but are unmethylated in cells expressing BLT1. Kato et al. (2000) also found that the promoter region of BLT1 is localized within the open reading frame encoding BLT2 (OMIM Ref. No. 605773).

[1449]

[1450] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1451] Yokomizo, T.; Izumi, T.; Chang, K.; Takuwa, Y.; Shimizu, T. : A G- protein- coupled receptor for leukotriene B4 that mediates chemotaxis. Nature 387: 620- 624, 1997. ; and

[1452] Kato, K.; Yokomizo, T.; Izumi, T.; Shimizu, T. : Cell- specific transcriptional regulation of human leukotriene B4 receptor gene. J. Exp. Med. 192: 413- 420, 2000.

[1453] Further studies establishing the function and utilities of LTB4R are found in John Hopkins OMIM database record ID 601531, and in cited publications listed in Table 5, which are hereby incorporated by reference.Lymphocyte antigen 75 (LY75, Accession NP_002340.1) is another

GAM25 target gene, herein designated TARGET GENE. LY75 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LY75, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LY75 BINDING SITE, designated SEQ ID:13431, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1454] Another function of GAM25 is therefore inhibition of Lymphocyte antigen 75 (LY75, Accession NP_002340.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY75.

[1455] Leucine zipper, putative tumor suppressor 1 (LZTS1, Accession NP_066300.1) is another GAM25 target gene, herein designated TARGET GENE. LZTS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LZTS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:9584, to the nucleotide sequence of

GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1456] Another function of GAM25 is therefore inhibition of Leucine zipper, putative tumor suppressor 1 (LZTS1, Accession NP_066300.1), a gene which is an essential component of the nucleoskeleton. potential role in crosslinking filaments or anchoring other molecules. it is essential for growth. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1.

[1457] The function of LZTS1 has been established by previous studies. Ishii et al. (1999) positionally cloned and characterized the FEZ1/LZTS1 (leucine zipper, putative tumor suppressor- 1) gene at 8p22, a region that is lost in many tumors, including prostate, breast, head and neck, esophageal, and urinary bladder carcinomas. The predicted FEZ1 protein contained a leucine- zipper region with similarity to the DNA- binding domain of the cAMP-responsive activating transcription factor- 5 (OMIM Ref. No. 606398). Northern blot analysis revealed that FEZ2 is expressed almost ubiquitously in normal tissues, although expression is most abundant in testes. FEZ1 expression was undetectable in more than 60% of epithelial tumors,

but FEZ1 mutations were found in primary esophageal cancers and in a prostate cancer cell line. Transcript analysis from several FEZ1- expressing tumors revealed truncated mRNAs, including a frameshift. Alteration and inactivation of the FEZ1 gene may play a role in various human tumors. Ishii et al. (2001) showed that introduction of FEZ1/LZTS1 into FEZ1/LZTS1- negative cancer cells resulted in suppression of tumorigenicity and reduced cell growth with accumulation of cells at late S- G2/M stage of the cell cycle. Their data showed that FEZ1/LZTS1 inhibits cancer cell growth through regulation of mitosis, and that its alterations result in abnormal cell growth

[1458]

[1459] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1460] Ishii, H.; Baffa, R.; Numata, S.- I.; Murakumo, Y.; Rattan, S.; Inoue, H.; Mori, M.; Fidanza, V.; Alder, H.; Croce, C. M. : The FEZ1 gene at chromosome 8p22 encodes a leucine-zipper protein, and its expression is altered in multiple human tumors. Proc. Nat. Acad. Sci. 96: 3928- 3933, 1999. ; and

[1461] Ishii, H.; Vecchione, A.; Murakumo, Y.; Baldassarre, G.;

Numata, S.; Trapasso, F.; Alder, H.; Baffa, R.; Croce, C. M. : FEZ1/LZTS1 gene at 8p22 suppresses cancer cell growth and regulat.

[1462] Further studies establishing the function and utilities of LZTS1 are found in John Hopkins OMIM database record ID 606551, and in cited publications listed in Table 5, which are hereby incorporated by reference.Male germ cell-associated kinase (MAK, Accession NP_005897.1) is another GAM25 target gene, herein designated TARGET GENE. MAK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAK BINDING SITE, designated SEQ ID:14390, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1463] Another function of GAM25 is therefore inhibition of Male germ cell-associated kinase (MAK, Accession NP_005897.1), a gene which plays an important role in spermatogenesis. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAK.

[1464] The function of MAK has been established by previous studies. Male germ cell- associated kinase is one of the protein kinases that was isolated by weak cross- hybridization with the v- ros (OMIM Ref. No. 165020) protein kinase sequence (Matsushime et al., 1990). The gene encoding this kinase is expressed almost exclusively in testis, mainly in germ cells at and/or after the pachytene stage, as 66- and 60- kD proteins that form a distinct complex with cellular phosphoprotein p210. The p210 protein is sufficiently phosphorylated in vitro by the MAK gene product at serine and threonine residues. These results suggest that the MAK gene plays an important role in spermatogenesis. Using a panel of DNA samples from an interspecific cross, Taketo et al. (1994) mapped the Mak gene to mouse chromosome 13 in an area situated between 2 regions that are homologous with human chromosome 6p and chromosome 5. Taketo et al. (1994) stated that preliminary Southern analysis of DNA samples from a panel of mouse/human somatic cell hybrids showed concordant hybridization of the MAK gene and the ROS1 gene, previously mapped to 6q22

[1465]

[1466] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[1467] Matsushime, H.; Jinno, A.; Takagi, N.; Shibuya, M. : A novel mammalian protein kinase gene (mak) is highly expressed in testicular germ cells at and after meiosis. Molec. Cell. Biol. 10: 2261- 2268, 1990. ; and

[1468] Taketo, M.; Jinno, A.; Yamaguchi, S.; Matushime, H.; Shibuya, M.; Seldin, M. F. : Mouse Mak gene for male germ cell- associated kinase maps to chromosome 13. Genomics 19: 397- 398, 1994.

[1469] Further studies establishing the function and utilities of MAK are found in John Hopkins OMIM database record ID 154235, and in cited publications listed in Table 5, which are hereby incorporated by reference.MAPA (Accession NP_660299.1) is another GAM25 target gene, herein designated TARGET GENE. MAPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAPA BINDING SITE, designated SEQ ID:1130, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1470] Another function of GAM25 is therefore inhibition of MAPA (Accession NP_660299.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPA.

[1471] Mediterranean fever (MEFV, Accession NP_000234.1) is another GAM25 target gene, herein designated TARGET GENE. MEFV BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEFV, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEFV BINDING SITE, designated SEQ ID:14301, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1472] Another function of GAM25 is therefore inhibition of Mediterranean fever (MEFV, Accession NP_000234.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV.

[1473] MGC10818 (Accession NP_085045.2) is another GAM25 target gene, herein designated TARGET GENE. MGC10818 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10818, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10818 BINDING SITE, designated SEQ ID:12698, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1474] Another function of GAM25 is therefore inhibition of MGC10818 (Accession NP_085045.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818.

[1475] MGC11386 (Accession NP_116322.1) is another GAM25 target gene, herein designated TARGET GENE. MGC11386 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11386, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11386 BINDING SITE, designated SEQ ID:9968, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1476] Another function of GAM25 is therefore inhibition of MGC11386 (Accession NP_116322.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11386.

[1477] MGC13204 (Accession NP_113653.1) is another GAM25 target gene, herein designated TARGET GENE. MGC13204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13204 BINDING SITE, designated SEQ ID:19279, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1478] Another function of GAM25 is therefore inhibition of MGC13204 (Accession NP_113653.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13204.

[1479] MGC14289 (Accession NP_542391.1) is another GAM25 target gene, herein designated TARGET GENE. MGC14289 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14289, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14289 BINDING SITE, designated SEQ ID:13910, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1480] Another function of GAM25 is therefore inhibition of MGC14289 (Accession NP_542391.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14289.

[1481] MGC15606 (Accession NP_659474.1) is another GAM25 target gene, herein designated TARGET GENE. MGC15606 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC15606, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15606 BINDING SITE, designated SEQ ID:9022, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1482] Another function of GAM25 is therefore inhibition of MGC15606 (Accession NP_659474.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC15606.

[1483] MGC17919 (Accession NP_653222.2) is another GAM25 target gene, herein designated TARGET GENE. MGC17919 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC17919, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC17919 BINDING SITE, designated SEQ ID:1373, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1484] Another function of GAM25 is therefore inhibition of MGC17919 (Accession NP_653222.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17919.

[1485] MGC1842 (Accession XP_037797.2) is another GAM25 target gene, herein designated TARGET GENE. MGC1842 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC1842, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:1785, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1486] Another function of GAM25 is therefore inhibition of MGC1842 (Accession XP_037797.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842.

[1487] MGC24180 (Accession NP_689565.1) is another GAM25 target gene, herein designated TARGET GENE. MGC24180 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC24180, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC24180 BINDING SITE, designated SEQ ID:9950, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1488] Another function of GAM25 is therefore inhibition of MGC24180 (Accession NP_689565.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC24180.

[1489] MGC2474 (Accession NP_076420.1) is another GAM25 target gene, herein designated TARGET GENE. MGC2474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:18706, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1490] Another function of GAM25 is therefore inhibition of MGC2474 (Accession NP_076420.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474.

[1491] MGC27345 (Accession XP_300964.1) is another GAM25 target gene, herein designated TARGET GENE. MGC27345 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MGC27345, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC27345 BINDING SITE, designated SEQ ID:17971, to the nucleotide sequence of

GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1492] Another function of GAM25 is therefore inhibition of MGC27345 (Accession XP_300964.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27345.

[1493] MGC3113 (Accession NP_076940.1) is another GAM25 target gene, herein designated TARGET GENE. MGC3113 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3113 BINDING SITE, designated SEQ ID:1235, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1494] Another function of GAM25 is therefore inhibition of MGC3113 (Accession NP_076940.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3113.

[1495] MGC33637 (Accession NP_689809.1) is another GAM25 target gene, herein designated TARGET GENE. MGC33637

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33637, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33637 BINDING SITE, designated SEQ ID:16595, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1496] Another function of GAM25 is therefore inhibition of MGC33637 (Accession NP_689809.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33637.

[1497] MGC35163 (Accession NP_689765.1) is another GAM25 target gene, herein designated TARGET GENE. MGC35163 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC35163, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35163 BINDING SITE, designated SEQ ID:6047, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1498] Another function of GAM25 is therefore inhibition of MGC35163 (Accession NP_689765.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35163.

[1499] MGC3771 (Accession NP_112232.1) is another GAM25 target gene, herein designated TARGET GENE. MGC3771 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC3771, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3771 BINDING SITE, designated SEQ ID:13827, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1500] Another function of GAM25 is therefore inhibition of MGC3771 (Accession NP_112232.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3771.

[1501] MGC40579 (Accession NP_689989.1) is another GAM25 target gene, herein designated TARGET GENE. MGC40579 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC40579, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC40579 BINDING SITE, designated SEQ ID:7100, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1502] Another function of GAM25 is therefore inhibition of MGC40579 (Accession NP_689989.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40579.

[1503] MGC50337 (Accession NP_848604.1) is another GAM25 target gene, herein designated TARGET GENE. MGC50337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC50337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC50337 BINDING SITE, designated SEQ ID:13976, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1504] Another function of GAM25 is therefore inhibition of MGC50337 (Accession NP_848604.1) . Accordingly, utili-

ties of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC50337.

[1505] Mhc class ii transactivator (MHC2TA, Accession NP_000237.1) is another GAM25 target gene, herein designated TARGET GENE. MHC2TA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MHC2TA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:15607, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1506] Another function of GAM25 is therefore inhibition of Mhc class ii transactivator (MHC2TA, Accession NP_000237.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA.

[1507] Melan-a (MLANA, Accession NP_005502.1) is another GAM25 target gene, herein designated TARGET GENE. MLANA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MLANA, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLANA BINDING SITE, designated SEQ ID:19169, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1508] Another function of GAM25 is therefore inhibition of Melan-a (MLANA, Accession NP_005502.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLANA.

[1509] moblak (Accession NP_570719.1) is another GAM25 target gene, herein designated TARGET GENE. moblak BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:17041, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1510] Another function of GAM25 is therefore inhibition of moblak (Accession NP_570719.1) . Accordingly, utilities of

GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak.

[1511] Molybdenum cofactor synthesis 3 (MOCS3, Accession NP_055299.1) is another GAM25 target gene, herein designated TARGET GENE. MOCS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MOCS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOCS3 BINDING SITE, designated SEQ ID:5363, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1512] Another function of GAM25 is therefore inhibition of Molybdenum cofactor synthesis 3 (MOCS3, Accession NP_055299.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS3.

[1513] Mannose phosphate isomerase (MPI, Accession NP_002426.1) is another GAM25 target gene, herein designated TARGET GENE. MPI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MPI BINDING SITE, designated SEQ ID:11116, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1514] Another function of GAM25 is therefore inhibition of Mannose phosphate isomerase (MPI, Accession NP_002426.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPI.

[1515] Myeloproliferative leukemia virus oncogene (MPL, Accession NP_005364.1) is another GAM25 target gene, herein designated TARGET GENE. MPL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MPL BINDING SITE, designated SEQ ID:12310, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1516] Another function of GAM25 is therefore inhibition of Myeloproliferative leukemia virus oncogene (MPL, Accession NP_005364.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MPL.

[1517] Mitochondrial ribosomal protein l44 (MRPL44, Accession NP_075066.1) is another GAM25 target gene, herein designated TARGET GENE. MRPL44 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPL44, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL44 BINDING SITE, designated SEQ ID:400, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1518] Another function of GAM25 is therefore inhibition of Mitochondrial ribosomal protein l44 (MRPL44, Accession NP_075066.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL44.

[1519] Mitochondrial ribosomal protein s27 (MRPS27, Accession NP_055899.1) is another GAM25 target gene, herein designated TARGET GENE. MRPS27 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPS27, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:8246, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1520] Another function of GAM25 is therefore inhibition of Mitochondrial ribosomal protein s27 (MRPS27, Accession NP_055899.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27.

[1521] MSTP028 (Accession NP_114160.1) is another GAM25 target gene, herein designated TARGET GENE. MSTP028 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MSTP028, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MSTP028 BINDING SITE, designated SEQ ID:9881, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1522] Another function of GAM25 is therefore inhibition of MSTP028 (Accession NP_114160.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MSTP028.

[1523] MtFMT (Accession NP_640335.1) is another GAM25 target gene, herein designated TARGET GENE. MtFMT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MtFMT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MtFMT BINDING SITE, designated SEQ ID:19169, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1524] Another function of GAM25 is therefore inhibition of MtFMT (Accession NP_640335.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MtFMT.

[1525] MTH2 (Accession NP_060753.1) is another GAM25 target gene, herein designated TARGET GENE. MTH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTH2 BINDING SITE, designated SEQ ID:12362, to the nucleotide se-

quence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1526] Another function of GAM25 is therefore inhibition of MTH2 (Accession NP_060753.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTH2.

[1527] MYLC2PL (Accession NP_612412.1) is another GAM25 target gene, herein designated TARGET GENE. MYLC2PL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MYLC2PL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYLC2PL BINDING SITE, designated SEQ ID:2680, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1528] Another function of GAM25 is therefore inhibition of MYLC2PL (Accession NP_612412.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLC2PL.

[1529] Myosin 5c (MYO5C, Accession NP_061198.1) is another GAM25 target gene, herein designated TARGET GENE. MYO5C BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by MYO5C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYO5C BINDING SITE, designated SEQ ID:3499, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1530] Another function of GAM25 is therefore inhibition of Myosin 5c (MYO5C, Accession NP_061198.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO5C.

[1531] Ndrg family member 3 (NDRG3, Accession NP_114402.1) is another GAM25 target gene, herein designated TARGET GENE. NDRG3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NDRG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE, designated SEQ ID:6322, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1532] Another function of GAM25 is therefore inhibition of Ndrg family member 3 (NDRG3, Accession NP_114402.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3.

[1533] Nadh dehydrogenase (ubiquinone) 1, subcomplex unknown, 2, 14.5kda (NDUFC2, Accession NP_004540.1) is another GAM25 target gene, herein designated TARGET GENE. NDUFC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NDUFC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDUFC2 BINDING SITE, designated SEQ ID:18323, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1534] Another function of GAM25 is therefore inhibition of Nadh dehydrogenase (ubiquinone) 1, subcomplex unknown, 2, 14.5kda (NDUFC2, Accession NP_004540.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFC2.

[1535] Nima (never in mitosis gene a)-related kinase 4 (NEK4,

Accession NP_003148.1) is another GAM25 target gene, herein designated TARGET GENE. NEK4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEK4 BINDING SITE, designated SEQ ID:15238, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1536] Another function of GAM25 is therefore inhibition of Nima (never in mitosis gene a)-related kinase 4 (NEK4, Accession NP_003148.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK4.

[1537] Neurofibromin 2 (bilateral acoustic neuroma) (NF2, Accession NP_057502.1) is another GAM25 target gene, herein designated TARGET GENE. NF2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NF2

BINDING SITE, designated SEQ ID:18419, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1538] Another function of GAM25 is therefore inhibition of Neurofibromin 2 (bilateral acoustic neuroma) (NF2, Accession NP_057502.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NF2.

[1539] Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NP_619728.2) is another GAM25 target gene, herein designated TARGET GENE. NFAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NFAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:18076, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1540] Another function of GAM25 is therefore inhibition of Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NP_619728.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with NFAT5.

[1541] Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NP_775321.1) is another GAM25 target gene, herein designated TARGET GENE. NFAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NFAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:18076, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1542] Another function of GAM25 is therefore inhibition of Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NP_775321.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5.

[1543] Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NP_619727.1) is another GAM25 target gene, herein designated TARGET GENE. NFAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NFAT5, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:18076, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1544] Another function of GAM25 is therefore inhibition of Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NP_619727.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5.

[1545] Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NP_006590.1) is another GAM25 target gene, herein designated TARGET GENE. NFAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NFAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:18076, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1546] Another function of GAM25 is therefore inhibition of Nuclear factor of activated t-cells 5, tonicity-responsive

(NFAT5, Accession NP_006590.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5.

[1547] Nudix (nucleoside diphosphate linked moiety x)-type motif 4 (NUDT4, Accession NP_061967.2) is another GAM25 target gene, herein designated TARGET GENE. NUDT4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUDT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUDT4 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1548] Another function of GAM25 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety x)-type motif 4 (NUDT4, Accession NP_061967.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT4.

[1549] Nuclear mitotic apparatus protein 1 (NUMA1, Accession NP_006176.1) is another GAM25 target gene, herein designated TARGET GENE. NUMA1 BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by NUMA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:14301, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1550] Another function of GAM25 is therefore inhibition of Nuclear mitotic apparatus protein 1 (NUMA1, Accession NP_006176.1), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1.

[1551] The function of NUMA1 has been established by previous studies. The NuMA protein was one of the first to be described as a cell cycle- related protein based on a distinct immunofluorescent staining pattern: in interphase, NuMA is present throughout the nucleus, and in mitosis, it localizes to the spindle apparatus (Lydersen and Pettijohn, 1980). Some patients with autoimmune disease have antibodies directed against the NuMA protein. The full-length NUMA cDNA (Compton et al., 1992; Yang et al.,

1992) predicts a protein with the largest known coiled-coil region in a protein. By fluorescence in situ hybridization, Sparks et al. (1993) demonstrated that the NUMA1 gene is present in single copy and located on 11q13. Acute promyelocytic leukemia (APL) is uniquely associated with chromosomal translocations that disrupt the gene encoding the retinoic acid receptor, RARA (OMIM Ref. No. 180240). In more than 99% of cases, this disruption results in the formation of a fusion of the RARA gene with the PML gene (OMIM Ref. No. 102578). In rare variants of APL, the RARA gene has been found to be fused to 1 of 2 other genes, PLZF (OMIM Ref. No. 176797) and NPM (OMIM Ref. No. 164040). Although RARA dysregulation is evidently important in APL, the role of the various fusion partners is unclear. Wells et al. (1997) characterized a fourth APL gene fusion, which linked exons encoding the retinoic acid and DNA- binding domains of RARA to 5-prime exons of NUMA1. The NUMA/RARA fusion protein existed in sheet- like nuclear aggregates with which normal NUMA partly colocalized. In contrast to t(15;17) APL (the usual variety) the intracellular distribution of PML was normal in these cells. Wells et al. (1997) suggested that interference with retinoid signaling, and not disruption of

PML organization, is essential to the APL phenotype. Their work implicated for the first time an element of the mitotic apparatus in the molecular pathogenesis of human malignancy. The proband of their study was a Caucasian male first seen at 6 months of age for investigation of multiple cutaneous lesions. Despite this unusual clinical presentation, peripheral blood morphology and cell- surface immunophenotype were typical of APL. Routine analysis of diagnostic bone marrow revealed a clonal cytogenetic abnormality, t(11;17)(q13;q21). The patient was treated with all- trans retinoic acid and achieved complete remission; he remained in morphologic remission 38 months after autologous bone marrow transplantation.

[1552]

[1553] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1554] Lydersen, B. K.; Pettijohn, D. E. : Human- specific nuclear protein that associates with the polar region of the mitotic apparatus: distribution in a human/hamster hybrid cell. Cell 22: 489- 499, 1980. ; and

[1555] Wells, R. A.; Catzavelos, C.; Kamel- Reid, S. : Fusion of retinoic acid receptor alpha to NuMA, the nuclear mitotic

apparatus protein, by a variant translocation in acute promyelocytic l.

[1556] Further studies establishing the function and utilities of NUMA1 are found in John Hopkins OMIM database record ID 164009, and in cited publications listed in Table 5, which are hereby incorporated by reference.NUP43 (Accession NP_078923.2) is another GAM25 target gene, herein designated TARGET GENE. NUP43 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUP43, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP43 BINDING SITE, designated SEQ ID:15705, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1557] Another function of GAM25 is therefore inhibition of NUP43 (Accession NP_078923.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP43.

[1558] Oligophrenin 1 (OPHN1, Accession NP_002538.1) is another GAM25 target gene, herein designated TARGET GENE. OPHN1 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by OPHN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:1657, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1559] Another function of GAM25 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NP_002538.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1.

[1560] Oxysterol binding protein-like 2 (OSBPL2, Accession NP_055650.1) is another GAM25 target gene, herein designated TARGET GENE. OSBPL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1561] Another function of GAM25 is therefore inhibition of Oxysterol binding protein-like 2 (OSBPL2, Accession NP_055650.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2.

[1562] Oxysterol binding protein-like 2 (OSBPL2, Accession NP_653081.1) is another GAM25 target gene, herein designated TARGET GENE. OSBPL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1563] Another function of GAM25 is therefore inhibition of Oxysterol binding protein-like 2 (OSBPL2, Accession NP_653081.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2.

[1564] Protocadherin alpha 9 (PCDHA9, Accession NP_054724.1) is another GAM25 target gene, herein designated TARGET

GENE. PCDHA9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDHA9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:12010, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1565] Another function of GAM25 is therefore inhibition of Protocadherin alpha 9 (PCDHA9, Accession NP_054724.1), a gene which is a calcium- dependent cell- adhesion protein. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9.

[1566] The function of PCDHA9 has been established by previous studies. Cadherins are calcium- dependent cell- cell adhesion molecules that mediate neural cell- cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHA9 is a member of the alpha cluster of protocadherin genes on 5q31. By screening a brain cDNA library for sequences with the potential to encode large proteins, Nagase et al. (1997) identified a cDNA encoding

PCDHA9, which they termed KIAA0345. The deduced protein has 842 amino acids. RT- PCR analysis detected strongest expression of KIAA0345 in kidney and testis, followed by brain, lung, pancreas, and ovary.

[1567]

[1568] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1569] Nagase, T.; Ishikawa, I.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; O'Hara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141- 150, 1997. ; and

[1570] Wu, Q.; Zhang, T.; Cheng, J.- F.; Kim, Y.; Grimwood, J.; Schmutz, J.; Dickson, M.; Noonan, J. P.; Zhang, M. Q.; Myers, R. M.; Maniatis, T. : Comparative DNA sequence analysis of mouse and.

[1571] Further studies establishing the function and utilities of PCDHA9 are found in John Hopkins OMIM database record ID 606315, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protocadherin beta 11 (PCDHB11, Accession NP_061754.1) is another

GAM25 target gene, herein designated TARGET GENE. PCDHB11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHB11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHB11 BINDING SITE, designated SEQ ID:13873, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1572] Another function of GAM25 is therefore inhibition of Protocadherin beta 11 (PCDHB11, Accession NP_061754.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB11.

[1573] Protocadherin beta 9 (PCDHB9, Accession NP_061992.2) is another GAM25 target gene, herein designated TARGET GENE. PCDHB9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHB9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHB9 BINDING SITE, designated SEQ ID:5363, to the nucleotide sequence of GAM25 RNA,

herein designated GAM RNA, also designated SEQ ID:206.

[1574] Another function of GAM25 is therefore inhibition of Protocadherin beta 9 (PCDHB9, Accession NP_061992.2), a gene which is a potential calcium- dependent cell- adhesion protein. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB9.

[1575] The function of PCDHB9 has been established by previous studies. Cadherins are calcium- dependent cell- cell adhesion molecules that mediate neural cell- cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHB9 is a member of the beta cluster of protocadherin genes on 5q31. For specific information on the PCDHB genes, see 604967. Vanhalst et al. (2001) determined that unlike most PCDHB proteins, PCDHB9 has not 1 but 2 PXXP motifs, putative SH3 protein- binding sites, at the end of the conserved region of its cytoplasmic domain.

[1576]

[1577] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1578] Vanhalst, K.; Kools, P.; Eynde, E. V.; van Roy, F. : The hu-

man and murine protocadherin- beta one- exon gene families show high evolutionary conservation, despite the difference in gene number. FEBS Lett. 495: 120- 125, 2001. ; and

[1579] Wu, Q.; Zhang, T.; Cheng, J.- F.; Kim, Y.; Grimwood, J.; Schmutz, J.; Dickson, M.; Noonan, J. P.; Zhang, M. Q.; Myers, R. M.; Maniatis, T. : Comparative DNA sequence analysis of mouse a.

[1580] Further studies establishing the function and utilities of PCDHB9 are found in John Hopkins OMIM database record ID 606335, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosducin-like (PDCL, Accession NP_005379.2) is another GAM25 target gene, herein designated TARGET GENE. PDCL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDCL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDCL BINDING SITE, designated SEQ ID:6421, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1581] Another function of GAM25 is therefore inhibition of

Phosducin-like (PDCL, Accession NP_005379.2), a gene which may regulate G- protein signaling and similar to phosducins. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCL.

[1582] The function of PDCL has been established by previous studies. Phosducin- like protein (PDCL) is a putative modulator of heterotrimeric G proteins. It was initially isolated as the product of an ethanol- responsive gene in neural cell cultures (Miles et al., 1993). PDCL shares extensive amino acid sequence homology with phosducin (PDC; 171490), a phosphoprotein expressed in retina and pineal gland that inhibits several G protein- coupled signaling pathways by binding to the beta- gamma subunits of G proteins. By screening a human genomic library with a rat Pdcl cDNA, Thibault et al. (1999) isolated a partial PDCL genomic sequence. They also identified several PDCL ESTs. The authors derived the complete PDCL coding sequence by aligning the genomic and EST sequences. The predicted 301- amino acid PDCL protein shows homology to areas of rat Pdc that contact G protein beta- gamma subunits. The N- terminal regions of human, rat, and Drosophila PDCL are highly homologous to each other,

but show little homology to the N- terminal region of rat Pdc. By somatic cell hybrid analysis, Thibault et al. (1999) mapped the PDCL gene to chromosome 9. Using a radiation hybrid mapping panel, they found that the PDCL gene is linked to markers D9S1876 and D9S1674.

[1587] Further studies establishing the function and utilities of PDCL are found in John Hopkins OMIM database record ID 604421, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphodiesterase 6b, cgmp-specific, rod, beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession

NP_000274.1) is another GAM25 target gene, herein designated TARGET GENE. PDE6B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE6B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE6B BINDING SITE, designated SEQ ID:2250, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1588] Another function of GAM25 is therefore inhibition of Phosphodiesterase 6b, cgmp-specific, rod, beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NP_000274.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE6B.

[1589] Phosphoribosylformylglycinamidine synthase (fgar amidotransferase) (PFAS, Accession NP_036525.1) is another GAM25 target gene, herein designated TARGET GENE. PFAS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFAS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of PFAS BINDING SITE, designated SEQ ID:12883, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1590] Another function of GAM25 is therefore inhibition of Phosphoribosylformylglycinamidine synthase (fgar amidotransferase) (PFAS, Accession NP_036525.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFAS.

[1591] Reserved (PHF6, Accession NP_115834.1) is another GAM25 target gene, herein designated TARGET GENE. PHF6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PHF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHF6 BINDING SITE, designated SEQ ID:19225, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1592] Another function of GAM25 is therefore inhibition of Reserved (PHF6, Accession NP_115834.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with PHF6.

[1593] Pbx/knotted 1 homeobox 1 (PKNOX1, Accession NP_004562.2) is another GAM25 target gene, herein designated TARGET GENE. PKNOX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKNOX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKNOX1 BINDING SITE, designated SEQ ID:4340, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1594] Another function of GAM25 is therefore inhibition of Pbx/knotted 1 homeobox 1 (PKNOX1, Accession NP_004562.2), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX1.

[1595] The function of PKNOX1 has been established by previous studies. As part of developing a transcript map of human chromosome 21, Chen et al. (1997) used exon trapping to identify portions of genes from chromosome 21- specific

cosmids. They identified a trapped exon that is identical to a region of the human expressed sequence tag (EST) L12425. Using the exon and EST as probes, they screened human fetal brain and kidney cDNA libraries and cloned the corresponding gene, which encodes a homeodomain-containing polypeptide of 436 amino acids. Chen et al. (1997) used the EST as a probe for Northern analysis and detected transcripts of 2.5 and 5 kb in every human tissue examined, including heart, brain and brain subregions, placenta, lung, liver, muscle, and several fetal tissues. The gene, designated PBX/knotted- 1 homeo box- 1 (OMIM Ref. No. PKNOX1), has a homeodomain closely related to those of the mammalian PBX family (such as mouse Meis1) and the plant knotted- 1 family (involved in plant development). Chen et al. (1997) used PCR amplification, hybridization, and genetic linkage analysis to map PKNOX1 to 21q22.3 between markers D21S212 and D21S25 on YAC350F7. By fluorescence in situ hybridization, Berthelsen et al. (1998) mapped the PKNOX1 gene to human chromosome 21q22.3 and mouse chromosome 17B/C.

[1596]

[1597] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[1598] Berthelsen, J.; Viggiano, L.; Schulz, H.; Ferretti, E.; Consalez, G. G.; Rocchi, M.; Blasi, F. : PKNOX1, a gene encoding PREP1, a new regulator of Pbx activity, maps on human chromosome 21q22.3 and murine chromosome 17B/C. Genomics 47: 323- 324, 1998. ; and

[1599] Chen, H.; Rossier, C.; Nakamura, Y.; Lynn, A.; Chakravarti, A.; Antonarakis, S. E. : Cloning of a novel homeobox-containing gene, PKNOX1, and mapping to human chromosome 21q22.3. Genomi.

[1600] Further studies establishing the function and utilities of PKNOX1 are found in John Hopkins OMIM database record ID 602100, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pro-melanin-concentrating hormone-like 1 (PMCHL1, Accession NP_114093.1) is another GAM25 target gene, herein designated TARGET GENE. PMCHL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PMCHL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMCHL1

BINDING SITE, designated SEQ ID:15693, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1601] Another function of GAM25 is therefore inhibition of Pro-melanin-concentrating hormone-like 1 (PMCHL1, Accession NP_114093.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMCHL1.

[1602] Pro-melanin-concentrating hormone-like 2 (PMCHL2, Accession NP_114094.1) is another GAM25 target gene, herein designated TARGET GENE. PMCHL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PMCHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMCHL2 BINDING SITE, designated SEQ ID:14075, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1603] Another function of GAM25 is therefore inhibition of Pro-melanin-concentrating hormone-like 2 (PMCHL2, Accession NP_114094.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with PMCHL2.

[1604] Peptidylprolyl isomerase d (cyclophilin d) (PPID, Accession NP_005029.1) is another GAM25 target gene, herein designated TARGET GENE. PPID BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPID, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPID BINDING SITE, designated SEQ ID:15356, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1605] Another function of GAM25 is therefore inhibition of Peptidylprolyl isomerase d (cyclophilin d) (PPID, Accession NP_005029.1), a gene which catalyzes the cis- trans isomerization of proline imidic peptide bonds in oligopeptides. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPID.

[1606] The function of PPID has been established by previous studies. The cyclophilins are a conserved gene family of peptidyl- prolyl cis- trans isomerases (PPIases; OMIM Ref. No. 123840), the members of which bind the immunosuppressant cyclosporin A. Cyclophilin 40 (CyP- 40, also

CYPD) was identified by Kieffer et al. (1992) as a 40- kD cyclophilin- like protein with PPIase activity. In the bovine uterus, CyP- 40 is a component of the estrogen receptor complex (see OMIM Ref. No. 133430). Kieffer et al. (1993) reported the cloning of a human cDNA homologous to the bovine CyP- 40. The cDNA encodes a predicted 370- amino acid protein. The amino end is similar to that of other cyclophilins, while the carboxyl region resembles FKBP59 (OMIM Ref. No. 600611), a component of the glucocorticoid receptor complex. Yokoi et al. (1996) showed that the cyclophilin 40 (or PPID) gene contains 10 exons and spans 14.2 kb of genomic DNA. Ten Alu repeats occur within noncoding regions of the gene. Yokoi et al. (1996) mapped the PPID gene to chromosome 4 using a panel of somatic cell hybrid DNAs. By fluorescence in situ hybridization, Ratajczak et al. (1997) mapped the PPID gene to 4q31.3.

[1607]

[1608] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1609] Ratajczak, T.; Woollatt, E.; Kumar, P.; Ward, B. K.; Minchin, R. F.; Baker, E. : Cyclophilin 40 (PPID) gene map position

4q31.3. Chromosome Res. 5: 151 only, 1997. ; and

[1610] Yokoi, H.; Shimizu, Y.; Anazawa, H.; Lefebvre, C. A.; Korneluk, R. G.; Ikeda; J.- E. : The structure and complete nucleotide sequence of the human cyclophilin 40 (PPID) gene. Genomics 35:.

[1611] Further studies establishing the function and utilities of PPID are found in John Hopkins OMIM database record ID 601753, and in cited publications listed in Table 5, which are hereby incorporated by reference.Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_055152.1) is another GAM25 target gene, herein designated TARGET GENE. PPIL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPIL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPIL2 BINDING SITE, designated SEQ ID:12323, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1612] Another function of GAM25 is therefore inhibition of Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_055152.1) . Accordingly, utilities of GAM25 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL2.

[1613] Protein kinase, lysine deficient 3 (PRKWNK3, Accession NP_065973.1) is another GAM25 target gene, herein designated TARGET GENE. PRKWNK3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKWNK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKWNK3 BINDING SITE, designated SEQ ID:5566, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1614] Another function of GAM25 is therefore inhibition of Protein kinase, lysine deficient 3 (PRKWNK3, Accession NP_065973.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK3.

[1615] PRO1787 (Accession NP_061076.1) is another GAM25 target gene, herein designated TARGET GENE. PRO1787 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO1787, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1787 BINDING SITE, designated SEQ ID:4037, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1616] Another function of GAM25 is therefore inhibition of PRO1787 (Accession NP_061076.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1787.

[1617] Prostaglandin e synthase (PTGES, Accession NP_004869.1) is another GAM25 target gene, herein designated TARGET GENE. PTGES BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGES, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGES BINDING SITE, designated SEQ ID:16132, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1618] Another function of GAM25 is therefore inhibition of Prostaglandin e synthase (PTGES, Accession NP_004869.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PTGES.

[1619] Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession NP_000952.1) is another GAM25 target gene, herein designated TARGET GENE. PTGIS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGIS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:11686, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1620] Another function of GAM25 is therefore inhibition of Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession NP_000952.1), a gene which catalyzes the isomerization of prostaglandin h2 to prostacyclin (= prostaglandin i2). Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGIS.

[1621] The function of PTGIS has been established by previous studies. Yokoyama et al. (1996) demonstrated that the prostacyclin synthase gene, which they symbolized PTGIS, consists of 10 exons spanning approximately 60 kb. All the splice donor and acceptor sites conformed to the GT/

AG rule. The major product of the primer extension analysis suggested that the transcription of the gene started from the positions around 49 bp upstream of the translation initiation codon. By fluorescence in situ hybridization, they demonstrated that the gene is located at 20q13.11-q13.13. Prostacyclin (also known as prostaglandin I2) is a potent vasodilator and inhibitor of platelet aggregation. The enzyme prostacyclin synthase (EC 5.3.99.4) catalyzes the isomerization of prostaglandin H2 (PGH2) to prostacyclin. Wang and Chen (1996) noted that although it has absorbance spectral features characteristic of the cytochrome P450s, PGIS has no monooxygenase activity and does not require an external source of electrons to initiate its enzyme reaction. Prostacyclin synthase is the single member of family 8 of the cytochrome P450 superfamily (Nelson et al., 1996).

[1622]

[1623] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1624] Wang, L.- H.; Chen, L. : Organization of the gene encoding human prostacyclin synthase. Biochem. Biophys. Res. Commun. 226: 631- 637, 1996. ; and

[1625] Yokoyama, C.; Yabuki, T.; Inoue, H.; Tone, Y.; Hara, S.; Hatae, T.; Nagata, M.; Takahashi, E.- I.; Tanabe, T. : Human gene encoding prostacyclin synthase (PTGIS): genomic organization, ch.

[1626] Further studies establishing the function and utilities of PTGIS are found in John Hopkins OMIM database record ID 601699, and in cited publications listed in Table 5, which are hereby incorporated by reference.PXK (Accession NP_060241.2) is another GAM25 target gene, herein designated TARGET GENE. PXK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PXK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PXK BINDING SITE, designated SEQ ID:18264, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1627] Another function of GAM25 is therefore inhibition of PXK (Accession NP_060241.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXK.

[1628] Rab33b, member ras oncogene family (RAB33B, Accession NP_112586.1) is another GAM25 target gene, herein des-

ignated TARGET GENE. RAB33B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB33B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:797, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1629] Another function of GAM25 is therefore inhibition of Rab33b, member ras oncogene family (RAB33B, Accession NP_112586.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B.

[1630] Rab39, member ras oncogene family (RAB39, Accession XP_084662.1) is another GAM25 target gene, herein designated TARGET GENE. RAB39 BINDING SITE1 and RAB39 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by RAB39, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE1 and RAB39 BINDING SITE2, designated SEQ

ID:9341 and SEQ ID:4103 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1631] Another function of GAM25 is therefore inhibition of Rab39, member ras oncogene family (RAB39, Accession XP_084662.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39.

[1632] RAI (Accession NP_006654.1) is another GAM25 target gene, herein designated TARGET GENE. RAI BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:14580, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1633] Another function of GAM25 is therefore inhibition of RAI (Accession NP_006654.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI.

[1634] Ras association (ralgds/af-6) domain family 2 (RASSF2,

Accession NP_055552.1) is another GAM25 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:13814, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1635] Another function of GAM25 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_055552.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[1636] Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739580.1) is another GAM25 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of RASSF2 BINDING SITE, designated SEQ ID:13814, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1637] Another function of GAM25 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739580.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[1638] Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739579.1) is another GAM25 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:13814, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1639] Another function of GAM25 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739579.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RASSF2.

[1640] Retinoblastoma binding protein 9 (RBBP9, Accession NP_006597.2) is another GAM25 target gene, herein designated TARGET GENE. RBBP9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RBBP9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBBP9 BINDING SITE, designated SEQ ID:1307, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1641] Another function of GAM25 is therefore inhibition of Retinoblastoma binding protein 9 (RBBP9, Accession NP_006597.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9.

[1642] RE2 (Accession NP_722561.1) is another GAM25 target gene, herein designated TARGET GENE. RE2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of RE2 BINDING SITE, designated SEQ ID:3366, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1643] Another function of GAM25 is therefore inhibition of RE2 (Accession NP_722561.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RE2.

[1644] Rhesus blood group, d antigen (RHD, Accession NP_057208.2) is another GAM25 target gene, herein designated TARGET GENE. RHD BINDING SITE1 and RHD BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by RHD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE1 and RHD BINDING SITE2, designated SEQ ID:10248 and SEQ ID:10248 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1645] Another function of GAM25 is therefore inhibition of Rhesus blood group, d antigen (RHD, Accession NP_057208.2), a gene which Major antigen of the RH sys-

tem. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD.

[1646] The function of RHD has been established by previous studies. Bennett et al. (1993) demonstrated that DNA testing can be used to determine RhD type in chorionic villus samples or amniotic cells. An RhD- negative woman whose partner is heterozygous may have preexisting anti-RhD antibodies that may or may not affect a subsequent fetus, depending on whether it is heterozygous. A safe method of determining fetal RhD type early in pregnancy would eliminate the risks to an RhD- negative fetus of fetal blood sampling or serial amniocenteses. Levine et al. (1941) showed that hemolytic disease of the fetus occurs in an RhD- positive fetus carried by an RhD- negative woman who has been immunized by transplacental passage of RhD- positive red cells during a previous pregnancy. When the father of the fetus being carried by a sensitized RhD- negative woman is heterozygous for RhD, as more than 50% of people are, half the fetuses will be RhD- negative and therefore require no treatment to avoid erythroblastosis fetalis. The others will be RhD- positive and require sophisticated investigative measures and

treatments. Lo et al. (1998) described a noninvasive method of determining fetal RhD status by analyzing maternal plasma. Using a fluorescent- based PCR assay that was sensitive enough to detect the amount of RhD DNA found in a single cell, they determined the RhD status of singleton fetuses from 57 RhD- negative women whose partners were heterozygous for the RhD gene. This method correctly identified the RhD status of 10 of 12 fetuses whose mothers were in their first trimester of pregnancy, that of all 30 fetuses whose mothers were in their second trimester, and that of all 15 fetuses whose mothers were in their third trimester. The method they described was rapid, providing results within 1 day, and represented a major advance in RhD genotyping.

[1647]

[1648] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1649] Bennett, P. R.; Le Van Kim, C.; Colin, Y.; Warwick, R. M.; Cherif- Zahar, B.; Fisk, N. M.; Cartron, J.- P. : Prenatal determination of fetal RhD type by DNA amplification. New Eng. J. Med. 329: 607- 610, 1993. ; and

M. F.; Chamberlain, P. F.; Poon, P. M. K.; Redman, C. W. G.; Wainscoat, J. S. : Prenatal diagnosis of fetal RhD status by mol.

[1651] Further studies establishing the function and utilities of RHD are found in John Hopkins OMIM database record ID 111680, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rhesus blood group, d antigen (RHD, Accession NP_057208.2) is another GAM25 target gene, herein designated TARGET GENE. RHD BINDING SITE1 and RHD BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by RHD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE1 and RHD BINDING SITE2, designated SEQ ID:19169 and SEQ ID:19169 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1652] Another function of GAM25 is therefore inhibition of Rhesus blood group, d antigen (RHD, Accession NP_057208.2), a gene which Major antigen of the RH system. Accordingly, utilities of GAM25 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with RHD.

[1653] The function of RHD has been established by previous studies. Bennett et al. (1993) demonstrated that DNA testing can be used to determine RhD type in chorionic villus samples or amniotic cells. An RhD- negative woman whose partner is heterozygous may have preexisting anti-RhD antibodies that may or may not affect a subsequent fetus, depending on whether it is heterozygous. A safe method of determining fetal RhD type early in pregnancy would eliminate the risks to an RhD- negative fetus of fetal blood sampling or serial amniocenteses. Levine et al. (1941) showed that hemolytic disease of the fetus occurs in an RhD- positive fetus carried by an RhD- negative woman who has been immunized by transplacental passage of RhD- positive red cells during a previous pregnancy. When the father of the fetus being carried by a sensitized RhD- negative woman is heterozygous for RhD, as more than 50% of people are, half the fetuses will be RhD- negative and therefore require no treatment to avoid erythroblastosis fetalis. The others will be RhD- positive and require sophisticated investigative measures and treatments. Lo et al. (1998) described a noninvasive

method of determining fetal RhD status by analyzing maternal plasma. Using a fluorescent- based PCR assay that was sensitive enough to detect the amount of RhD DNA found in a single cell, they determined the RhD status of singleton fetuses from 57 RhD- negative women whose partners were heterozygous for the RhD gene. This method correctly identified the RhD status of 10 of 12 fetuses whose mothers were in their first trimester of pregnancy, that of all 30 fetuses whose mothers were in their second trimester, and that of all 15 fetuses whose mothers were in their third trimester. The method they described was rapid, providing results within 1 day, and represented a major advance in RhD genotyping.

[1657] Lo, Y. M. D.; Hjelm, N. M.; Fidler, C.; Sargent, I. L.; Murphy, M. F.; Chamberlain, P. F.; Poon, P. M. K.; Redman, C. W. G.;

Wainscoat, J. S. : Prenatal diagnosis of fetal RhD status by mol.

[1658] Further studies establishing the function and utilities of RHD are found in John Hopkins OMIM database record ID 111680, and in cited publications listed in Table 5, which are hereby incorporated by reference.Retinitis pigmentosa 2 (x-linked recessive) (RP2, Accession NP_008846.1) is another GAM25 target gene, herein designated TARGET GENE. RP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:9423, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1659] Another function of GAM25 is therefore inhibition of Retinitis pigmentosa 2 (x-linked recessive) (RP2, Accession NP_008846.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2.

[1660] SBLF (Accession NP_006864.2) is another GAM25 target gene, herein designated TARGET GENE. SBLF BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by SBLF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SBLF BINDING SITE, designated SEQ ID:5568, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1661] Another function of GAM25 is therefore inhibition of SBLF (Accession NP_006864.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBLF.

[1662] Sex comb on midleg-like 2 (drosophila) (SCML2, Accession NP_006080.1) is another GAM25 target gene, herein designated TARGET GENE. SCML2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCML2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCML2 BINDING SITE, designated SEQ ID:18167, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1663] Another function of GAM25 is therefore inhibition of Sex

comb on midleg-like 2 (drosophila) (SCML2, Accession NP_006080.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML2.

[1664] SCN3B (Accession NP_060870.1) is another GAM25 target gene, herein designated TARGET GENE. SCN3B BINDING SITE1 and SCN3B BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SCN3B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCN3B BINDING SITE1 and SCN3B BINDING SITE2, designated SEQ ID:1161 and SEQ ID:6473 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1665] Another function of GAM25 is therefore inhibition of SCN3B (Accession NP_060870.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN3B.

[1666] SDS-RS1 (Accession NP_612441.1) is another GAM25 target gene, herein designated TARGET GENE. SDS-RS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SDS-RS1, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDS-RS1 BINDING SITE, designated SEQ ID:3444, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1667] Another function of GAM25 is therefore inhibition of SDS-RS1 (Accession NP_612441.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDS-RS1.

[1668] Spondyloepiphyseal dysplasia, late (SEDL, Accession NP_055378.1) is another GAM25 target gene, herein designated TARGET GENE. SEDL BINDING SITE1 and SEDL BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SEDL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE1 and SEDL BINDING SITE2, designated SEQ ID:13505 and SEQ ID:18323 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1669] Another function of GAM25 is therefore inhibition of

Spondyloepiphyseal dysplasia, late (SEDL, Accession NP_055378.1), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. and therefore may be associated with Spondyloepiphyseal dysplasia. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Spondyloepiphyseal dysplasia, and of other diseases and clinical conditions associated with SEDL.

[1670] The function of SEDL has been established by previous studies. Gedeon et al. (2001) reviewed the spectrum of mutations found in 30 of 36 unrelated cases of X- linked SEDL ascertained from different ethnic populations. It brought the total number of different disease- associated mutations to 21 and showed that they were distributed throughout the SEDL gene. Four recurrent mutations accounted for 13 of the 30 (43%). Haplotype analyses and the diverse ethnic origins of the patients supported recurrent mutations. Two patients with large deletions of SEDL exons were found, 1 with childhood onset of painful complications, the other relatively free of additional symptoms. Since no clear genotype/phenotype correlation could be established, they concluded that the complete unaltered SEDL gene product is essential for normal bone

growth. Christie et al. (2001) characterized the SEDL mutations in 4 unrelated spondyloepiphyseal dysplasia tarda kindreds of European origin. They identified 2 nonsense and 2 intragenic deletional frameshift mutations. The nonsense mutations occurred in exons 4 and 6. Both of the intragenic deletions, which were approximately 750 and 1300 to 1445 bp in size, involved intron 5 and part of exon 6 and resulted in frameshifts that led to premature termination signals.

[1671]

[1672] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1673] Christie, P. T.; Curley, A.; Nesbit, M. A.; Chapman, C.; Genet, S.; Harper, P. S.; Keeling, S. L.; Wilkie, A. O. M.; Winter, R. M.; Thakker, R. V. : Mutational analysis in X-linked spondyloepiphyseal dysplasia tarda. J. Clin. Endocr. Metab. 86: 3233- 3236, 2001. ; and

[1674] Gedeon, A. K.; Tiller, G. E.; Le Merrer, M.; Heuertz, S.; Tranebjaerg, L.; Chitayat, D.; Robertson, S.; Glass, I. A.; Savarirayan, R.; Cole, W. G.; Rimoin, D. L.; Kousseff, B. G.; Ohas.

[1675] Further studies establishing the function and utilities of

SEDL are found in John Hopkins OMIM database record ID 300202, and in cited publications listed in Table 5, which are hereby incorporated by reference.Selenoprotein n, 1 (SEPN1, Accession NP_065184.1) is another GAM25 target gene, herein designated TARGET GENE. SEPN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEPN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEPN1 BINDING SITE, designated SEQ ID:19019, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1676] Another function of GAM25 is therefore inhibition of Selenoprotein n, 1 (SEPN1, Accession NP_065184.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPN1.

[1677] Small edrk-rich factor 1a (telomeric) (SERF1A, Accession NP_068802.1) is another GAM25 target gene, herein designated TARGET GENE. SERF1A BINDING SITE1 and SERF1A BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SERF1A, corresponding

to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERF1A BINDING SITE1 and SERF1A BINDING SITE2, designated SEQ ID:13469 and SEQ ID:4475 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1678] Another function of GAM25 is therefore inhibition of Small edrk-rich factor 1a (telomeric) (SERF1A, Accession NP_068802.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1A.

[1679] Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NP_075267.1) is another GAM25 target gene, herein designated TARGET GENE. SERF1B BINDING SITE1 and SERF1B BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SERF1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE1 and SERF1B BINDING SITE2, designated SEQ ID:13469 and SEQ ID:4475 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA,

also designated SEQ ID:206.

[1680] Another function of GAM25 is therefore inhibition of Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NP_075267.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B.

[1681] Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 9 (SERPINB9, Accession NP_004146.1) is another GAM25 target gene, herein designated TARGET GENE. SERPINB9 BINDING SITE1 and SERPINB9 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SERPINB9, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE1 and SERPINB9 BINDING SITE2, designated SEQ ID:5564 and SEQ ID:8945 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1682] Another function of GAM25 is therefore inhibition of Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 9 (SERPINB9, Accession NP_004146.1), a gene which may be a serpin serine protease inhibitor that inter-

acts with granzyme B (GZMB). Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9.

[1683] The function of SERPINB9 has been established by previous studies. Serine proteinase inhibitors (serpins) are a large superfamily of proteins which bind to and inactivate serine proteinases. These interactions are involved in many cellular processes including coagulation, fibrinolysis, complement fixation, matrix remodeling, and apoptosis. Sprecher et al. (1995) isolated PI8 (OMIM Ref. No. 601697) and PI9 cDNAs from a human placenta cDNA library. The authors found that PI9 encodes a 374- amino acid polypeptide with over 60% identity with PI6. Northern blot analysis by Sprecher et al. (1995) demonstrated that PI9 is expressed as 2 transcripts of 3.4 and 4.4 kb which were detected in greatest abundance in lung and placenta. In searching for serpins related to PI6, Sun et al. (1996) isolated and cloned PI9 from human bone marrow mRNA using a PCR cloning strategy. They confirmed that the sequence of PI9 is closely related to PI6 (OMIM Ref. No. 173321) and the viral serpin CrmA. Sun et al. (1996) showed that PI9 forms an SDS- resistant complex with granzyme B (OMIM Ref. No. 123910), suggesting that

these 2 proteins may form a physiologically significant serpin- serine proteinase interaction. Sun et al. (1996) also observed that PI9 was expressed in immune tissue, including lymphocytes, natural killer cell leukemia cell lines, and peripheral blood mononuclear cells. Sun et al. (1996) used fractionation experiments to show that PI9 is localized to the cytosol, in a separate subcellular compartment from granzyme B. PI9 was identified as an endogenous inhibitor of caspase- 1 (OMIM Ref. No. 147678). Krieg et al. (2001) reported that PI9 mRNA and protein are rapidly and directly induced by estrogen in human liver cells. Using transient transfections to assay PI9 promoter truncations and mutations, they showed that this strong estrogen induction is mediated by a unique downstream estrogen responsive unit (ERU) approximately 200 nucleotides downstream of the transcription start site. They also demonstrated estrogen- dependent binding of ER to the cellular PI9 promoter. The ERU consists of an imperfect estrogen response element (ERE) palindrome immediately adjacent to a direct repeat containing two consensus ERE half- sites separated by 13 nucleotides (DR13). In transient transfections, all 4 of the ERE half-sites in the imperfect ERE and in the DR13 were important

for estrogen inducibility. They concluded that a direct repeat can function with an imperfect ERE palindrome to confer estrogen inducibility on a native gene, which extends the repertoire of DNA sequences able to function as EREs.

[1684]

[1685] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1686] Sun, J.; Bird, C. H.; Sutton, V.; McDonald, L.; Coughlin, P. B.; De Jong, T. A.; Trapani, J. A.; Bird, P. I. : A cytosolic granzyme B inhibitor related to the viral apoptotic regulator cytokine response modifier A is present in cytotoxic lymphocytes. J. Biol. Chem. 271: 27802- 27809, 1996. ; and

[1687] Krieg, S. A.; Krieg, A. J.; Shapiro, D. J. : A unique downstream estrogen responsive unit mediates estrogen induction of proteinase inhibitor- 9, a cellular inhibitor of IL-1- beta- conver.

[1688] Further studies establishing the function and utilities of SERPINB9 are found in John Hopkins OMIM database record ID 601799, and in cited publications listed in Table 5, which are hereby incorporated by refer-

ence.Sh3-domain binding protein 4 (SH3BP4, Accession NP_055336.1) is another GAM25 target gene, herein designated TARGET GENE. SH3BP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3BP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:5112, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1689] Another function of GAM25 is therefore inhibition of Sh3-domain binding protein 4 (SH3BP4, Accession NP_055336.1), a gene which is of unknown function, contains SH3- domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4.

[1690] The function of SH3BP4 has been established by previous studies. A major element of the cornea is a transparent stroma produced and maintained by corneal fibroblasts, or keratocytes. Using differential display of RNA from normal and macular corneal dystrophy cultured keratocytes,

followed by screening a corneal fibroblast library, Dunlevy et al. (1999) identified a cDNA encoding SH3BP4. The deduced 963- amino acid SH3BP4 protein contains 3 asn- pro- phe (NPF) motifs, which are EPS15 (OMIM Ref. No. 600051) homology (EH)- binding sites (see OMIM Ref. No. NUMB; 603728); an SH3 domain; a PXXP motif; a bipartite nuclear targeting signal; and a tyrosine phosphorylation site. Sequence analysis predicted that SH3BP4 is identical to a 479- amino acid EH- binding protein (Wong et al., 1995) except for the presence of an additional 73 N- terminal and 411 mid- to C- terminal residues in SH3BP4. Northern blot analysis revealed ubiquitous expression of a 5.6- kb transcript, with highest levels in pancreas, low levels in kidney, skeletal muscle, and liver, and lowest levels in lung and brain. Expression was also detected in cultured normal keratocytes. Using FISH, Dunlevy et al. (1999) mapped the SH3BP4 gene to 2q37.1- q37.2.

[1691]

[1692] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1693] Dunlevy, J. R.; Berryhill, B. L.; Vergnes, J.- P.; SundarRaj, N.; Hassell, J. R. : Cloning, chromosomal localization, and

characterization of cDNA from a novel gene, SH3BP4, expressed by human corneal fibroblasts. Genomics 62: 519-524, 1999. ; and

[1694] Wong, W. T.; Schumacher, C.; Salcini, A. E.; Romano, A.; Castagnino, P.; Pelicci, P. G.; DiFiore, P. P. : A protein-binding domain, EH, identified in the receptor tyrosine kinase substrat.

[1695] Further studies establishing the function and utilities of SH3BP4 are found in John Hopkins OMIM database record ID 605611, and in cited publications listed in Table 5, which are hereby incorporated by reference.Short stature homeobox (SHOX, Accession NP_006874.1) is another GAM25 target gene, herein designated TARGET GENE. SHOX BINDING SITE1 and SHOX BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by SHOX, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE1 and SHOX BINDING SITE2, designated SEQ ID:6046 and SEQ ID:2929 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1696] Another function of GAM25 is therefore inhibition of Short stature homeobox (SHOX, Accession NP_006874.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX.

[1697] Sialic acid binding ig-like lectin 11 (SIGLEC11, Accession NP_443116.1) is another GAM25 target gene, herein designated TARGET GENE. SIGLEC11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIGLEC11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIGLEC11 BINDING SITE, designated SEQ ID:17145, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1698] Another function of GAM25 is therefore inhibition of Sialic acid binding ig-like lectin 11 (SIGLEC11, Accession NP_443116.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC11.

[1699] Tal1 (scl) interrupting locus (SIL, Accession NP_003026.1) is another GAM25 target gene, herein designated TARGET

GENE. SIL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIL BINDING SITE, designated SEQ ID:15610, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1700] Another function of GAM25 is therefore inhibition of Tal1 (scl) interrupting locus (SIL, Accession NP_003026.1), a gene which may be required for axial development and left- right specification and therefore may be associated with Prominent midline neural tube defects, abnormal left- right development. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Prominent midline neural tube defects, abnormal left- right development, and of other diseases and clinical conditions associated with SIL.

[1701] The function of SIL has been established by previous studies. Aplan et al. (1997) demonstrated that transgenic mice in which inappropriately expressed scl protein, driven by sil regulatory elements, developed aggressive T-cell malignancies in collaboration with a misexpressed

LMO1 (OMIM Ref. No. 186921) protein, thus recapitulating the situation seen in a subset of human T- cell ALL. Aplan et al. (1997) also demonstrated that inappropriately expressed scl can interfere with the development of other tissues derived from mesoderm. Finally, Aplan et al. (1997) demonstrated that an scl construct lacking the scl transactivation domain collaborates with misexpressed LMO1, demonstrating that the scl transactivation domain is dispensable for oncogenesis, and supporting the hypothesis that the scl gene product exerts its oncogenic action through a dominant- negative mechanism.

[1702] Animal model experiments lend further support to the function of SIL. Izraeli et al. (1999) disrupted the Sil gene in mouse by homologous recombination. Heterozygotes were normal but mutant homozygotes died in utero after embryonic day 10.5. Between embryonic days 7.5 and 8.5, striking developmental anomalies appeared in Sil - /- embryos. In addition to reduced size and limited developmental progress compared to wildtype embryos, Sil mutants displayed prominent midline neural tube defects. These included delay or failure of neural tube closure and holoprosencephaly (OMIM Ref. No. 236100). In addition, left- right development was abnormal. In heterozygous

and wildtype embryos, the embryonic heart tube always loops to the right, whereas in Sil mutants the direction of heart looping is randomized. Nodal (OMIM Ref. No. 601265), lefty- 2 (OMIM Ref. No. 603037) and Pitx2 (OMIM Ref. No. 601542) are normally expressed only in the left lateral- plate mesoderm before heart looping, with continued expression of Pitx2 on the left side of the looping heart tube. In contrast, Sil mutants showed bilaterally symmetric expression of nodal and Pitx2 at all stages examined. For lefty- 2, most Sil - /- embryos also showed bilaterally symmetric expression. However, a small number of mutants expressed lefty- 2 only on the right. Expression of both Patched (OMIM Ref. No. 601309) and Gli1 (OMIM Ref. No. 165220) was greatly reduced in Sil - /- embryos. Shh (OMIM Ref. No. 600725) and Hnf3b (OMIM Ref. No. 600288) were expressed in the notochord of Sil mutants. However, the markedly reduced expression of their target genes indicated that Shh signaling in the midline may be blocked in Sil - /- embryos. Comparison with Shh mutant embryos, which have axial defects but normal cardiac looping, indicated that the consequences of abnormal midline development for left- right patterning depend on the time of onset, duration, and severity of dis-

ruption of the normal asymmetric patterns of expression of nodal, lefty- 2, and Pitx2.

[1703] It is appreciated that the abovementioned animal model for SIL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[1704] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1705] Aplan, P. D.; Jones, C. A.; Chervinsky, D. S.; Zhao, X.; Ellsworth, M.; Wu, C.; McGuire, E. A.; Gross, K. W. : An scl gene product lacking the transactivation domain induces bony abnormalities and cooperates with LMO1 to generate T- cell malignancies in transgenic mice. EMBO J. 16: 2408- 2419, 1997. ; and

[1706] Izraeli, S.; Lowe, L. A.; Bertness, V. L.; Good, D. J.; Dorward, D. W.; Kirsch, I. R.; Kuehn, M. R. : The SIL gene is required for mouse embryonic axial development and left-right spec.

[1707] Further studies establishing the function and utilities of SIL are found in John Hopkins OMIM database record ID 181590, and in cited publications listed in Table 5, which are hereby incorporated by reference.Signal-regulatory

protein beta 1 (SIRPB1, Accession NP_006056.1) is another GAM25 target gene, herein designated TARGET GENE. SIRPB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:14288, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1708] Another function of GAM25 is therefore inhibition of Signal-regulatory protein beta 1 (SIRPB1, Accession NP_006056.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1.

[1709] Solute carrier family 12 (potassium/chloride transporters), member 8 (SLC12A8, Accession NP_078904.1) is another GAM25 target gene, herein designated TARGET GENE. SLC12A8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC12A8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of SLC12A8 BINDING SITE, designated SEQ ID:2145, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1710] Another function of GAM25 is therefore inhibition of Solute carrier family 12 (potassium/chloride transporters), member 8 (SLC12A8, Accession NP_078904.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A8.

[1711] Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NP_005064.1) is another GAM25 target gene, herein designated TARGET GENE. SLC15A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC15A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:9045, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1712] Another function of GAM25 is therefore inhibition of Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NP_005064.1), a gene which is a

H(+)- coupled peptide transporter. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC15A1.

[1713] The function of SLC15A1 has been established by previous studies. In mammalian small intestine, the proton-coupled peptide transporter is responsible for the absorption of small peptides arising from digestion of dietary proteins. Fei et al. (1994) isolated a cDNA clone encoding a hydrogen ion/peptide cotransporter from a rabbit intestinal cDNA library. Liang et al. (1995) screened a human intestinal cDNA library with a probe derived from the rabbit cotransporter cDNA and identified a cDNA which, when expressed in HeLa cells or in Xenopus laevis oocytes, induced proton- dependent peptide transport activity. The predicted protein consisted of 708 amino acids with 12 membrane- spanning domains and 2 putative sites for protein kinase C- dependent phosphorylation. The cDNA- induced transport process accepted dipeptides, tripeptides, and amino beta- lactam antibiotics as substrates, but could not transport free amino acids. The human cotransporter showed 81% identity and 92% similarity to the rabbit cotransporter, but showed only a weak homology to the proton- coupled peptide

transport proteins present in bacteria and yeast. By analysis of somatic cell hybrids and by isotopic in situ hybridization, Liang et al. (1995) mapped the human gene to 13q33- q34. Adibi (1997) reviewed the biology and function of the human intestinal oligopeptide transporter, which he symbolized PEPT1. Studies indicated that it transports dipeptides and tripeptides but not free amino acids or peptides with more than 3 amino acid residues and that its driving force for uphill transport requires proton binding and presence of an inside- negative membrane potential. A membrane protein, HTP1, which appeared to be associated with the oligopeptide transporter, had also been cloned. Adibi (1997) pointed out the importance of the transporter in nutritional and pharmacologic therapies; for example, it has allowed the use of oligopeptides as a source of nitrogen for enteral feeding and the use of the oral route for delivery of peptidomimetic drugs such as beta- lactam antibiotics.

[1714]

[1715] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1718] Further studies establishing the function and utilities of SLC15A1 are found in John Hopkins OMIM database record ID 600544, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 16 (monocarboxylic acid transporters), member 4 (SLC16A4, Accession NP_004687.1) is another GAM25 target gene, herein designated TARGET GENE. SLC16A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC16A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC16A4 BINDING SITE, designated SEQ ID:9949, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1719] Another function of GAM25 is therefore inhibition of So-

lute carrier family 16 (monocarboxylic acid transporters), member 4 (SLC16A4, Accession NP_004687.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A4.

[1720] Solute carrier family 24 (sodium/potassium/calcium exchanger), member 1 (SLC24A1, Accession NP_004718.1) is another GAM25 target gene, herein designated TARGET GENE. SLC24A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC24A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC24A1 BINDING SITE, designated SEQ ID:4560, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1721] Another function of GAM25 is therefore inhibition of Solute carrier family 24 (sodium/potassium/calcium exchanger), member 1 (SLC24A1, Accession NP_004718.1), a gene which is a critical component of the visual transduction cascade, controlling the calcium concentration of outer segments during light and darkness. Accordingly, utilities of GAM25 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SLC24A1.

[1722] The function of SLC24A1 has been established by previous studies. By screening a human retinal cDNA library using the entire bovine rod sodium/potassium/calcium (Na- Ca+K) exchanger cDNA as a probe, Tucker et al. (1998) cloned the human NCKX1 gene. Human NCKX1 codes for a protein of 1,081 amino acids that shows 64% overall identity with the bovine protein. The 2 sets of putative transmembrane domains and their short connecting loops showed 94% identity, while the extracellular loop at the amino terminus was only 59% identical. Tucker et al. (1998) determined the genomic structure of the NCKX1 gene and found 1 intron in the 5- prime untranslated region and 8 within the coding region. Exon length varies from 54 to 2,037 bp Using fluorescence in situ hybridization and analysis of a radiation hybrid panel, Tucker et al. (1998) mapped the NCKX1 gene to chromosome 15q22

[1723]

[1724] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1725] Tucker, J. E.; Winkfein, R. J.; Cooper, C. B.; Schnetkamp, P.

P. : cDNA cloning of the human retinal rod Na- Ca + K exchanger: comparison with a revised bovine sequence. Invest. Ophthal. Vis. Sci. 39: 435- 440, 1998. ; and

[1726] Tucker, J. E.; Winkfein, R. J.; Murthy, S. K.; Friedman, J. S.; Walter, M. A.; Demetrick, D. J.; Schnetkamp, P. P. M. : Chromosomal localization and genomic organization of the human retina.

[1727] Further studies establishing the function and utilities of SLC24A1 are found in John Hopkins OMIM database record ID 603617, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NP_110404.1) is another GAM25 target gene, herein designated TARGET GENE. SLC2A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A10 BINDING SITE, designated SEQ ID:8872, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1728] Another function of GAM25 is therefore inhibition of So-

lute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NP_110404.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A10.

[1729] Solute carrier family 7 (cationic amino acid transporter, y+ system), member 6 (SLC7A6, Accession NP_003974.1) is another GAM25 target gene, herein designated TARGET GENE. SLC7A6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC7A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:6848, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1730] Another function of GAM25 is therefore inhibition of Solute carrier family 7 (cationic amino acid transporter, y+ system), member 6 (SLC7A6, Accession NP_003974.1), a gene which is involved in mediating amino acid transport. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6.

[1731] The function of SLC7A6 has been established by previous studies. Using RT- PCR with degenerate primers to screen for amino acid transporters in opossum kidney, followed by searching EST databases, Torrents et al. (1998) obtained a cDNA encoding SLC7A6, which they called y(+)LAT2. SLC7A6 is identical to the KIAA0245 gene reported by Nagase et al. (1996). Sequence analysis predicted that SLC7A6 is a 515- amino acid, typical organic solute transporter protein with 12 transmembrane domains, 3 potential phosphorylation sites, and N- and C-terminal cytoplasmic segments. SLC7A6 shares 75% amino acid identity with the opossum sequence and y(+)LAT1 (SLC7A7; 603593). By RT- PCR analysis, Nagase et al. (1996) detected SLC7A6 expression in all tissues tested except liver; expression was weak in pancreas and highest in thymus.

[1732]

[1733] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1736] Further studies establishing the function and utilities of SLC7A6 are found in John Hopkins OMIM database record ID 605641, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synaptosomal-associated protein, 23kda (SNAP23, Accession NP_003816.2) is another GAM25 target gene, herein designated TARGET GENE. SNAP23 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNAP23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE, designated SEQ ID:12860, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1737] Another function of GAM25 is therefore inhibition of Synaptosomal-associated protein, 23kda (SNAP23, Accession NP_003816.2), a gene which is essential component of the high affinity receptor for the general membrane fusion machinery. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23.

[1738] The function of SNAP23 has been established by previous studies. Synaptosomal- associated proteins (SNAPs) are involved in the process of membrane fusion in intracellular vesicle traffic. By fluorescence in situ hybridization, Lazo et al. (2001) mapped the SNAP23 gene to chromosome 15q21- q22. Lazo et al. (2001) suggested that alterations in the SNAP23 gene may be involved in neurologic and other diseases with defects in vesicle- membrane fusion processes that map to 15q15- q21.

[1739]

[1740] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1743] Further studies establishing the function and utilities of SNAP23 are found in John Hopkins OMIM database record ID 602534, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synaptosomal-associated protein, 23kda (SNAP23, Accession NP_570710.1) is another GAM25 target gene, herein designated TARGET GENE. SNAP23 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNAP23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE, designated SEQ ID:12860, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1744] Another function of GAM25 is therefore inhibition of Synaptosomal-associated protein, 23kda (SNAP23, Accession NP_570710.1), a gene which is essential component of the high affinity receptor for the general membrane fusion machinery. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23.

[1745] The function of SNAP23 has been established by previous studies. Synaptosomal- associated proteins (SNAPs) are involved in the process of membrane fusion in intracellular vesicle traffic. By fluorescence in situ hybridization, Lazo et al. (2001) mapped the SNAP23 gene to chromosome 15q21- q22. Lazo et al. (2001) suggested that alterations in the SNAP23 gene may be involved in neurologic and other diseases with defects in vesicle- membrane fusion processes that map to 15q15- q21.

[1746]

[1747] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

splicing, and isoforms of the human synaptosome- associated protein- 23 gene implicated in vesicle- membrane fusion processes. Hum. Genet. 108: 211- 215, 2001. ; and

[1749] Mollinedo, F.; Lazo, P. A. : Identification of two isoforms of the vesicle- membrane fusion protein SNAP- 23 in human neutrophils and HL- 60 cells. Biochem. Biophys. Res. Commun. 231: 808.

[1750] Further studies establishing the function and utilities of SNAP23 are found in John Hopkins OMIM database record ID 602534, and in cited publications listed in Table 5, which are hereby incorporated by reference.SNARK (Accession NP_112214.1) is another GAM25 target gene, herein designated TARGET GENE. SNARK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNARK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNARK BINDING SITE, designated SEQ ID:17183, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1751] Another function of GAM25 is therefore inhibition of

SNARK (Accession NP_112214.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNARK.

[1752] Sorting nexin 15 (SNX15, Accession NP_037438.2) is another GAM25 target gene, herein designated TARGET GENE. SNX15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX15 BINDING SITE, designated SEQ ID:2251, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1753] Another function of GAM25 is therefore inhibition of Sorting nexin 15 (SNX15, Accession NP_037438.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX15.

[1754] Sorting nexin 15 (SNX15, Accession NP_680086.1) is another GAM25 target gene, herein designated TARGET GENE. SNX15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by SNX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX15 BINDING SITE, designated SEQ ID:2251, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1755] Another function of GAM25 is therefore inhibition of Sorting nexin 15 (SNX15, Accession NP_680086.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX15.

[1756] SNX22 (Accession NP_079074.1) is another GAM25 target gene, herein designated TARGET GENE. SNX22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNX22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX22 BINDING SITE, designated SEQ ID:1855, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1757] Another function of GAM25 is therefore inhibition of

SNX22 (Accession NP_079074.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX22.

[1758] SNX27 (Accession NP_112180.4) is another GAM25 target gene, herein designated TARGET GENE. SNX27 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNX27, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX27 BINDING SITE, designated SEQ ID:5280, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1759] Another function of GAM25 is therefore inhibition of SNX27 (Accession NP_112180.4) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX27.

[1760] SPCX (Accession NP_775260.1) is another GAM25 target gene, herein designated TARGET GENE. SPCX BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SPCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of SPCX BINDING SITE, designated SEQ ID:4224, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1761] Another function of GAM25 is therefore inhibition of SPCX (Accession NP_775260.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPCX.

[1762] Speckle-type poz protein (SPOP, Accession NP_003554.1) is another GAM25 target gene, herein designated TARGET GENE. SPOP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SPOP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPOP BINDING SITE, designated SEQ ID:17186, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1763] Another function of GAM25 is therefore inhibition of Speckle-type poz protein (SPOP, Accession NP_003554.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPOP.

[1764] Sarcalumenin (SRL, Accession XP_064152.3) is another GAM25 target gene, herein designated TARGET GENE. SRL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRL BINDING SITE, designated SEQ ID:5566, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1765] Another function of GAM25 is therefore inhibition of Sarcalumenin (SRL, Accession XP_064152.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRL.

[1766] Synovial sarcoma translocation, chromosome 18 (SS18, Accession NP_005628.1) is another GAM25 target gene, herein designated TARGET GENE. SS18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SS18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SS18 BINDING SITE,

designated SEQ ID:13018, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1767] Another function of GAM25 is therefore inhibition of Synovial sarcoma translocation, chromosome 18 (SS18, Accession NP_005628.1), a gene which is a putative transcriptional activator. and therefore is associated with Human synovial sarcomas. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Human synovial sarcomas., and of other diseases and clinical conditions associated with SS18.

[1768] The function of SS18 has been established by previous studies. Human synovial sarcomas contain a recurrent and specific chromosomal translocation t(X;18)(p11.2;q11.2). By screening a synovial sarcoma cDNA library with a YAC spanning the X chromosome breakpoint, Clark et al. (1994) identified a hybrid transcript that contained 5-prime sequences mapping to chromosome 18 and 3-prime sequences mapping to the X chromosome (see OMIM Ref. No. SSX1; 312820). A probe from the chromosome 18 gene sequence, symbolized SS18, detected genomic rearrangements in 10 of 13 synovial sarcomas. The chromosome 18 gene was symbolized SYT by Clark et al.

(1994), but that symbol had already been used for synaptotagmin (OMIM Ref. No. 185605). Sequencing of cDNA clones showed that the normal SS18 gene encodes a protein rich in glutamine, proline, and glycine, and that in synovial sarcoma, rearrangement of the SS18 gene results in the formation of a fusion protein. Both the chromosome 18 and the X chromosome components failed to exhibit significant homology to known gene sequences. The SYT protein appears to act as a transcriptional coactivator and the SSX proteins as corepressors. Thaete et al. (1999) investigated the functional domains of the proteins. The SYT protein was found to contain a novel conserved 54- amino acid domain at the N terminus of the protein (the SNH domain) that is found in proteins from a wide variety of species, and a C- terminal domain, rich in glutamine, proline, glycine, and tyrosine (the QPGY domain), which contains the transcriptional activator sequences. Deletion of the SNH domain resulted in a more active transcriptional activator, suggesting that this domain acts as an inhibitor of the activation domain. The C- terminal SSX domain present in the SYT- SSX translocation protein contributes a transcriptional repressor domain to the protein. Thus, the fusion protein has transcriptional activating and re-

pressing domains. Thaete et al. (1999) demonstrated that the human homolog of the SNF2/Brahma protein BRM (SMARCA2; 600014) colocalizes with SYT and SYT- SSX in nuclear speckles, and also interacts with SYT and SYT-SSX proteins in vitro. They suggested that this interaction may provide an explanation of how the SYT protein activates gene transcription.

[1769]

[1770] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1771] Clark, J.; Rocques, P. J.; Crew, A. J.; Gill, S.; Shipley, J.; Chan, A. M.- L.; Gusterson, B. A.; Cooper, C. S. : Identification of novel genes, SYT and SSX, involved in the t(X;18)(p11.2;q11.2) translocation found in human synovial sarcoma. Nature Genet. 7: 502- 508, 1994. ; and

[1772] Thaete, C.; Brett, D.; Monaghan, P.; Whitehouse, S.; Rennie, G.; Rayner, E.; Cooper, C. S.; Goodwin, G. : Functional domains of the SYT and SYT- SSX synovial sarcoma translocation prote.

[1773] Further studies establishing the function and utilities of SS18 are found in John Hopkins OMIM database record ID 600192, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Stomatin (STOM, Accession NP_004090.3) is another GAM25 target gene, herein designated TARGET GENE. STOM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STOM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STOM BINDING SITE, designated SEQ ID:12669, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1774] Another function of GAM25 is therefore inhibition of Stomatin (STOM, Accession NP_004090.3) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STOM.

[1775] Synaptotagmin xiii (SYT13, Accession NP_065877.1) is another GAM25 target gene, herein designated TARGET GENE. SYT13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYT13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of SYT13 BINDING SITE, designated SEQ ID:14302, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1776] Another function of GAM25 is therefore inhibition of Synaptotagmin xiii (SYT13, Accession NP_065877.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13.

[1777] Taf11 rna polymerase ii, tata box binding protein (tbp)-associated factor, 28kda (TAF11, Accession NP_005634.1) is another GAM25 target gene, herein designated TARGET GENE. TAF11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TAF11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAF11 BINDING SITE, designated SEQ ID:11091, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1778] Another function of GAM25 is therefore inhibition of Taf11 rna polymerase ii, tata box binding protein (tbp)-associated factor, 28kda (TAF11, Accession NP_005634.1), a gene which plays a central role in medi-

ating promoter responses to various activators and repressors. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF11.

[1779] The function of TAF11 has been established by previous studies. Mengus et al. (1995) immunopurified TFIID, separated the components by SDS- PAGE and transferred the bands to PVDF membrane for tryptic digestion, purified the resulting TAF peptides by reverse phase chromatography and subsequently obtained partial peptide sequence data. Degenerate oligomers of TAF2I (also referred to as TAFII28) were then used to screen a HeLa cell cDNA library. The TAFII28 cDNA encodes a 211- amino acid protein containing the expected tryptic peptides. It is about 50% identical to the Drosophila TAFII30- beta protein. The authors demonstrated that different domains of TAFII28 interact with TAFII18 (TAF2K; 600774) and TBP. Birck et al. (1998) determined the crystal structure of the human TBP- associated factor TAFII28/TAFII18 heterodimer and showed that these TAFIIs form a novel histone- like pair in the TFIID complex. The histone folds in TAFII28 and TAFII18 were not predicted from their primary sequence, indicating that these TAFIIs define a novel family of atypi-

cal histone fold sequences.

[1780]

[1781] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1782] Birck, C.; Poch, O.; Romier, C.; Ruff, M.; Mengus, G.; Lavigne, A.- C.; Davidson, I.; Moras, D. : Human TAFII28 and TAFII18 interact through a histone fold encoded by atypical evolutionary conserved motifs also found in the SPT3 family. Cell 94: 239- 249, 1998. ; and

[1783] Mengus, G.; May, M.; Jacq, X.; Staub, A.; Tora, L.; Chambon, P.; Davidson, I. : Cloning and characterization of hTAFII18, hTAFII20 and hTAFII28: three subunits of the human transcriptio.

[1784] Further studies establishing the function and utilities of TAF11 are found in John Hopkins OMIM database record ID 600772, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tap binding protein (tapasin) (TAPBP, Accession NP_003181.3) is another GAM25 target gene, herein designated TARGET GENE. TAPBP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TAPBP, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:14128, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1785] Another function of GAM25 is therefore inhibition of Tap binding protein (tapasin) (TAPBP, Accession NP_003181.3), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP.

[1786] The function of TAPBP has been established by previous studies. Newly assembled major histocompatibility complex (MHC) class I molecules (see OMIM Ref. No. 142800), together with the endoplasmic reticulum (ER) chaperone calreticulin (OMIM Ref. No. 109091), interact with the transporter associated with antigen processing (TAP1; 170260) through a molecule called tapasin (Sadasivan et al., 1996). By molecular cloning of tapasin, Ortmann et al. (1997) found it to be a type I transmembrane glycoprotein encoded by an MHC- linked gene. The mature protein has 428 amino acids with a single N- linked glycosylation site

at position 233. It is a member of the immunoglobulin superfamily with a probable cytoplasmic ER retention signal. Up to 4 MHC class I/tapasin complexes were found to bind to each TAP molecule in Daudi and L001 cells. Expression of tapasin in a negative mutant human cell line restored class I/TAP association and normal class I cell surface expression. Tapasin expression also corrected the defective recognition of virus- infected cells of the same line by class I- restricted cytotoxic T cells, thus establishing a critical functional role for tapasin in MHC class I- restricted antigen processing. Herberg et al. (1998) identified an EST encoding the mouse tapasin homolog. Mayer and Klein (2001) proposed that tapasin is in reality an MHC class I molecule with a different function from that currently executed by conventional class I molecules. They based this proposal on the amino acid sequence similarity between tapasin and conventional class I molecules, on similarity of predicted tertiary structure and domain organization of the molecules, on similarity of exon/intron organization of the encoding genes, and on the mapping of the class IA and tapasin genes into the same chromosomal region in all jawed vertebrates that had been tested to that time (Michalova et al., 2000).

[1787]

[1788] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1789] Mayer, W. E.; Klein, J. : Is tapasin a modified Mhc class I molecule? Immunogenetics 53: 719- 723, 2001. ; and

[1790] Ortmann, B.; Copeman, J.; Lehner, P. J.; Sadasivan, B.; Herberg, J. A.; Grandea, A. G.; Riddell, S. R.; Tampe, R.; Spies, T.; Trowsdale, J.; Cresswell, P. : A critical role for tapasin.

[1791] Further studies establishing the function and utilities of TAPBP are found in John Hopkins OMIM database record ID 601962, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tyrosine aminotransferase (TAT, Accession NP_000344.1) is another GAM25 target gene, herein designated TARGET GENE. TAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAT BINDING SITE, designated SEQ ID:14386, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1792] Another function of GAM25 is therefore inhibition of Tyrosine aminotransferase (TAT, Accession NP_000344.1), a gene which is tyrosine aminotransferase and strongly similar to rat Rn.9947, which plays a role in gluconeogenesis. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAT.

[1793] The function of TAT has been established by previous studies. Richner (1938) and Hanhart (1947) described an oculocutaneous syndrome characterized by herpetiform corneal ulcers and painful punctate keratoses of digits, palms, and soles. Richner (1938) described skin lesions in brother and sister. Only the brother had corneal lesions. Hanhart (1947) reported that the parents of his patient were second cousins. Hanhart (1947) also described associated severe mental and somatic retardation. The pedigree he reported was reproduced by Waardenburg et al. (1961). Waardenburg et al. (1961) described children of a first- cousin marriage, one with the full syndrome and one with only corneal changes. Ventura et al. (1965) described the syndrome in 2 sons of first- cousin parents. Buist (1967) referred to studies of a child with tyrosinemia and tyrosine transaminase deficiency, but normal p- hydrox-

yphenylpyruvic acid oxidase. Phenylalanine level was normal. Hydroxyphenylpyruvic acid was elevated in the urine. Fellman et al. (1969) reported chemical studies on the same patient. Only the mitochondrial form of tyrosine aminotransferase (TAT) was present in the liver. The soluble form of TAT (EC 2.6.1.5) was lacking. The patient had markedly elevated tyrosine blood levels and an increase in urinary p- hydroxyphenylpyruvate and p- hydroxyphenyllactate. A regulator gene for tyrosine transaminase is X-linked (OMIM Ref. No. 314350). Goldsmith et al. (1973) demonstrated tyrosinemia and phenylaceticacidemia in this disorder. Their patient was the 14- year- old son of consanguineous Italian parents. The urine contained excessive P- hydroxyphenylactic acid. Urinary P- hydroxyphenylpyruvic acid was normal. Clinical and biochemical improvement accompanied low phenylalanine- low tyrosine diet. They suggested that soluble TAT may be deficient. Mitochondrial tyrosine transaminase is normal. Beinfang et al. (1976) described the ophthalmologic findings in the patient reported by Goldsmith et al. (1973). This condition is also known as tyrosinemia with palmar and plantar keratosis and keratitis. Garibaldi et al. (1977) observed this disorder, which they called oculocutaneous ty-

rosinosis, in a 42- month- old girl and her maternal aunt. The parents of the maternal aunt were first cousins. They emphasized the importance of early diagnosis in order to prevent mental retardation by means of a diet restricted in phenylalanine and tyrosine. Hunziker (1980) reported brother and sister with unusually late onset (about age 15). Their patients' skin lesions were improved with a diet restricted in phenylalanine and tyrosine. In a consanguineous sibship, Rehak et al. (1981) reported 4 cases of Richner- Hanhart syndrome. Cutaneous manifestations were typical but the eyes were not involved, suggesting heterogeneity in this disorder. Bohnert and Anton- Lamprecht (1982) reported unique ultrastructural changes: thickening of the granular layer and increased synthesis of tonofibrils and keratohyalin; in the ridged palmar or plantar skin, large numbers of microtubules and unusually tight packing of tonofibrillar masses, which contained tubular channels or inclusions of microtubules. The authors assumed that increased cohesion and tight packing of tonofilaments prevent normal spreading of keratohyalin and result in its globular appearance. Further, they suggested that excessive amounts of intracellular tyrosine enhance crosslinks between aggregated tonofilaments. In

an Ashkenazi Jewish family, Chitayat et al. (1992) observed 2 adult sibs, offspring of a first- cousin marriage, with persistent hypertyrosinemia. A curious feature was that the affected female sib, aged 41 years, had hypertyrosinemia and characteristic oculocutaneous signs; the brother, aged 39 years, had hypertyrosinemia but no oculocutaneous disease. Both sibs had 2 children; none had signs of metabolic fetopathy.

[1794]

[1795] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1796] Goldsmith, L. A.; Kang, E. S.; Bienfang, D. C.; Jimbow, K.; Gerald, P. S.; Baden, H. P. : Tyrosinemia with plantar and palmar keratosis and keratitis. J. Pediat. 83: 798- 805, 1973. ; and

[1797] Hunziker, N. : Richner- Hanhart syndrome and tyrosinemia type II. Dermatologica 160: 180- 189, 1980.

[1798] Further studies establishing the function and utilities of TAT are found in John Hopkins OMIM database record ID 276600, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-cell leukemia/lymphoma 6 (TCL6, Accession NP_055233.1) is another

GAM25 target gene, herein designated TARGET GENE. TCL6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE, designated SEQ ID:17146, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1799] Another function of GAM25 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession NP_055233.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[1800] T-cell leukemia/lymphoma 6 (TCL6, Accession NP_065577.2) is another GAM25 target gene, herein designated TARGET GENE. TCL6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE, designated SEQ ID:17146, to the nucleotide

sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1801] Another function of GAM25 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession NP_065577.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[1802] T-cell leukemia/lymphoma 6 (TCL6, Accession NP_036600.2) is another GAM25 target gene, herein designated TARGET GENE. TCL6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE, designated SEQ ID:17146, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1803] Another function of GAM25 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession NP_036600.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[1804] T-cell leukemia/lymphoma 6 (TCL6, Accession NP_065575.1) is another GAM25 target gene, herein designated TARGET GENE. TCL6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE, designated SEQ ID:17146, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1805] Another function of GAM25 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession NP_065575.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[1806] TIM50L (Accession XP_053074.2) is another GAM25 target gene, herein designated TARGET GENE. TIM50L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIM50L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIM50L BIND-

ING SITE, designated SEQ ID:20014, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1807] Another function of GAM25 is therefore inhibition of TIM50L (Accession XP_053074.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIM50L.

[1808] Toll-like receptor 5 (TLR5, Accession NP_003259.2) is another GAM25 target gene, herein designated TARGET GENE. TLR5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TLR5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TLR5 BINDING SITE, designated SEQ ID:5535, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1809] Another function of GAM25 is therefore inhibition of Toll-like receptor 5 (TLR5, Accession NP_003259.2), a gene which participates in the innate immune response to bacterial flagellins. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLR5.

[1810] The function of TLR5 has been established by previous studies. By searching an EST database for human Toll homologs, Chaudhary et al. (1998) identified cDNA sequences from 2 genes that they called TIL3 and TIL4 (TLR2; 603028). Muzio et al. (2000) determined the differential expression pattern of the TLRs in leukocytes. Like TLR2 and TLR4, TLR5 was expressed in myelomonocytic cells, but at lower levels. Hayashi et al. (2001) showed that expression of TLR5 induces NF- kappa- B activation and TNFA (OMIM Ref. No. 191160) production. Pathogen- associated molecular patterns (PAMPs) known to stimulate other TLR family members failed to stimulate TLR5; however, luciferase reporter assays indicated TLR5 activation in gram- positive and - negative bacterial culture supernatants. By fractionation of Listeria culture supernatants followed by SDS- PAGE, Hayashi et al. (2001) identified flagellin as the TLR5 ligand. Flagellin, a principal component of bacterial flagella, is a virulence factor recognized by the innate immune system in plants, insects, and mammals. Expression of flagellin in nonflagellated bacteria resulted in TLR5 activation, and deletion of flagellin from flagellated bacteria abrogated TLR5 activation. Hayashi et al. (2001) demonstrated that injection of flag-

ellin induces the production of IL6 (OMIM Ref. No. 147620) in wildtype mice, but not in those lacking the MyD88 (OMIM Ref. No. 602170) adaptor protein, required for TLR signaling. Hayashi et al. (2001) concluded that TLR5 is a pattern- recognition receptor and that its PAMP is flagellin, a protein with conserved N and C termini in a broad group of motile pathogens.

[1811]

[1812] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1813] Chaudhary, P. M.; Ferguson, C.; Nguyen, V.; Nguyen, O.; Massa, H. F.; Eby, M.; Jasmin, A.; Trask, B. J.; Hood, L.; Nelson, P. S. : Cloning and characterization of two Toll/ interleukin- 1 receptor- like genes TIL3 and TIL4: evi- dence for a multi- gene receptor family in humans. Blood 91: 4020- 4027, 1998. ; and

[1814] Hayashi, F.; Smith, K. D.; Ozinsky, A.,; Hawn, T. R.; Yi, E. C.; Goodlett, D. R.; Eng, J. K.; Akira, S.; Underhill, D. M.; Aderem, A. : The innate immune response to bacterial flagellin.

[1815] Further studies establishing the function and utilities of TLR5 are found in John Hopkins OMIM database record ID

603031, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transmembrane protease, serine 3 (TMPRSS3, Accession NP_076927.1) is another GAM25 target gene, herein designated TARGET GENE. TMPRSS3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TMPRSS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMPRSS3 BINDING SITE, designated SEQ ID:2655, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1816] Another function of GAM25 is therefore inhibition of Transmembrane protease, serine 3 (TMPRSS3, Accession NP_076927.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMPRSS3.

[1817] Transmembrane protease, serine 3 (TMPRSS3, Accession NP_115780.1) is another GAM25 target gene, herein designated TARGET GENE. TMPRSS3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TMPRSS3, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMPRSS3 BINDING SITE, designated SEQ ID:2655, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1818] Another function of GAM25 is therefore inhibition of Transmembrane protease, serine 3 (TMPRSS3, Accession NP_115780.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMPRSS3.

[1819] Transmembrane protease, serine 3 (TMPRSS3, Accession NP_115777.1) is another GAM25 target gene, herein designated TARGET GENE. TMPRSS3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TMPRSS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMPRSS3 BINDING SITE, designated SEQ ID:2655, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1820] Another function of GAM25 is therefore inhibition of

Transmembrane protease, serine 3 (TMPRSS3, Accession NP_115777.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMPRSS3.

[1821] Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_003833.3) is another GAM25 target gene, herein designated TARGET GENE. TNFRSF10B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF10B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:5563, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1822] Another function of GAM25 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_003833.3), a gene which forms complex that induces apoptosis. and therefore may be associated with Squamous cell carcinoma . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Squamous cell carcinoma ., and of other diseases

and clinical conditions associated with TNFRSF10B.

[1823] The function of TNFRSF10B has been established by previous studies. The 8p21 region contains a number of putative tumor suppressor genes and is a frequent site of translocations in head and neck tumors. Pai et al. (1998) determined the genomic structure of KILLER/DR5 and performed sequence analysis of all 10 coding exons in 20 primary head and neck cancers with allelic loss of 8p. To screen for a subset of mutations localized to the functional cytoplasmic death domain, they sequenced this region in an additional 40 primary head and neck cancers. They found 2 alterations, including a 2- bp insertion at a minimal repeat site, introducing a premature stop codon and resulting in a truncated protein. This KILLER/DR5 mutation was also present in the germline of the affected patient, and the tumor did not have a p53 mutation by sequence analysis. Transfection studies in head and neck squamous cell carcinoma and colon and ovarian carcinoma cell lines revealed loss of growth suppressive function associated with the tumor- derived KILLER/DR5 truncation mutant. These observations provided the first evidence for mutation of a TRAIL death receptor gene in a human cancer, leading to loss of its apoptotic function.

The second alteration identified by Pai et al. (1998) was a single T- to- C point mutation at residue 1109 that resulted in an amino acid change from val to ala. This mutation was not present in the germline; however, sequence analysis of p53 in this tumor revealed a point mutation of T to C in codon 242, resulting in a change from arg to cys. In a case of a head and neck squamous cell carcinoma (OMIM Ref. No. 601400), Pai et al. (1998) found a 2- bp insertion in the TNFRSF10B gene at a minimal repeat site (ACAC) at residue 1065, which introduced a premature stop codon and resulted in a truncated protein. Sequence analysis of normal tissue from the patient showed that the truncating mutation was also present in the germline, and that the tumor did not have a p53 mutation. A significant impairment in the ability of the truncation mutant to suppress colony formation was observed when mutant cDNA was transfected into human colon and ovarian cancer cell lines. In the wildtype transfected cells, there was no observed colony survival; however, there was more than 50% colony growth in cells transfected with the tumor- derived mutant. Pai et al. (1998) suspected that the mutant retained partial function, because its overexpression in a background of cells containing the endogenous wildtype

gene could further reduce the percentage of colony survival.

[1824]

[1825] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1826] Pai, S. I.; Wu, G. S.; Ozoren, N.; Wu, L.; Jen, J.; Sidransky, D.; El- Deiry, W. S. : Rare loss- of- function mutation of a death receptor gene in head and neck cancer. Cancer Res. 58: 3513- 3518, 1998. ; and

[1827] Screaton, G. R.; Mongkolsapaya, J.; Xu, X.- N.; Cowper, A. E.; McMichael, A. J.; Bell, J. I. : TRICK2, a new alternatively spliced receptor that transduces the cytotoxic signal from TRAIL.

[1828] Further studies establishing the function and utilities of TNFRSF10B are found in John Hopkins OMIM database record ID 603612, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_671716.1) is another GAM25 target gene, herein designated TARGET GENE. TNFRSF10B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded

by TNFRSF10B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:5563, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1829] Another function of GAM25 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_671716.1), a gene which forms complex that induces apoptosis. and therefore may be associated with Squamous cell carcinoma . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Squamous cell carcinoma ., and of other diseases and clinical conditions associated with TNFRSF10B.

[1830] The function of TNFRSF10B has been established by previous studies. The 8p21 region contains a number of putative tumor suppressor genes and is a frequent site of translocations in head and neck tumors. Pai et al. (1998) determined the genomic structure of KILLER/DR5 and performed sequence analysis of all 10 coding exons in 20 primary head and neck cancers with allelic loss of 8p. To screen for a subset of mutations localized to the func-

tional cytoplasmic death domain, they sequenced this region in an additional 40 primary head and neck cancers. They found 2 alterations, including a 2- bp insertion at a minimal repeat site, introducing a premature stop codon and resulting in a truncated protein. This KILLER/DR5 mutation was also present in the germline of the affected patient, and the tumor did not have a p53 mutation by sequence analysis. Transfection studies in head and neck squamous cell carcinoma and colon and ovarian carcinoma cell lines revealed loss of growth suppressive function associated with the tumor- derived KILLER/DR5 truncation mutant. These observations provided the first evidence for mutation of a TRAIL death receptor gene in a human cancer, leading to loss of its apoptotic function. The second alteration identified by Pai et al. (1998) was a single T- to- C point mutation at residue 1109 that resulted in an amino acid change from val to ala. This mutation was not present in the germline; however, sequence analysis of p53 in this tumor revealed a point mutation of T to C in codon 242, resulting in a change from arg to cys. In a case of a head and neck squamous cell carcinoma (OMIM Ref. No. 601400), Pai et al. (1998) found a 2- bp insertion in the TNFRSF10B gene at a minimal repeat site

(ACAC) at residue 1065, which introduced a premature stop codon and resulted in a truncated protein. Sequence analysis of normal tissue from the patient showed that the truncating mutation was also present in the germline, and that the tumor did not have a p53 mutation. A significant impairment in the ability of the truncation mutant to suppress colony formation was observed when mutant cDNA was transfected into human colon and ovarian cancer cell lines. In the wildtype transfected cells, there was no observed colony survival; however, there was more than 50% colony growth in cells transfected with the tumor- derived mutant. Pai et al. (1998) suspected that the mutant retained partial function, because its overexpression in a background of cells containing the endogenous wildtype gene could further reduce the percentage of colony survival.

[1832] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1833] Pai, S. I.; Wu, G. S.; Ozoren, N.; Wu, L.; Jen, J.; Sidransky, D.; El- Deiry, W. S. : Rare loss- of- function mutation of a death receptor gene in head and neck cancer. Cancer Res.

58: 3513- 3518, 1998. ; and

[1834] Screaton, G. R.; Mongkolsapaya, J.; Xu, X.- N.; Cowper, A. E.; McMichael, A. J.; Bell, J. I. : TRICK2, a new alternatively spliced receptor that transduces the cytotoxic signal from TRAIL.

[1835] Further studies establishing the function and utilities of TNFRSF10B are found in John Hopkins OMIM database record ID 603612, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tumor necrosis factor receptor superfamily, member 11a, activator of nfkb (TNFRSF11A, Accession NP_003830.1) is another GAM25 target gene, herein designated TARGET GENE. TNFRSF11A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFRSF11A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF11A BINDING SITE, designated SEQ ID:9317, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1836] Another function of GAM25 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 11a,

activator of nfkb (TNFRSF11A, Accession NP_003830.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF11A.

[1837] TPH2 (Accession NP_775489.1) is another GAM25 target gene, herein designated TARGET GENE. TPH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TPH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPH2 BINDING SITE, designated SEQ ID:3185, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1838] Another function of GAM25 is therefore inhibition of TPH2 (Accession NP_775489.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPH2.

[1839] Tripartite motif-containing 16 (TRIM16, Accession NP_006461.2) is another GAM25 target gene, herein designated TARGET GENE. TRIM16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIM16, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM16 BINDING SITE, designated SEQ ID:1828, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1840] Another function of GAM25 is therefore inhibition of Tripartite motif-containing 16 (TRIM16, Accession NP_006461.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM16.

[1841] Tripartite motif-containing 5 (TRIM5, Accession NP_149023.1) is another GAM25 target gene, herein designated TARGET GENE. TRIM5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRIM5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM5 BINDING SITE, designated SEQ ID:4983, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1842] Another function of GAM25 is therefore inhibition of Tri-

partite motif-containing 5 (TRIM5, Accession NP_149023.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM5.

[1843] Transient receptor potential cation channel, subfamily m, member 6 (TRPM6, Accession NP_060132.3) is another GAM25 target gene, herein designated TARGET GENE. TRPM6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:18834, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1844] Another function of GAM25 is therefore inhibition of Transient receptor potential cation channel, subfamily m, member 6 (TRPM6, Accession NP_060132.3), a gene which contains a predicted ion channel domain and a protein kinase domain. and therefore is associated with Hypomagnesemia with secondary hypocalcemia. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Hypomagnesemia with secondary hypocalcemia,

and of other diseases and clinical conditions associated with TRPM6.

[1845] The function of TRPM6 has been established by previous studies. Schlingmann et al. (2002) and Walder et al. (2002) studied hypomagnesemia with secondary hypocalcemia (HSH; 602014), which maps to 9q22, and by positional cloning identified the TRPM6 gene as the site of causative mutations. Walder et al. (2002) found that the complete cDNA sequence of TRPM6 contains 8,429 nucleotides, including an open reading frame of 6,069 nucleotides. The predicted TRPM6 protein contains 2,022 amino acids, has a calculated molecular mass of roughly 234 kD, and contains a predicted ion channel domain and a protein kinase domain. Northern blot analysis detected an 8.5- kb transcript abundantly expressed in kidney and colon. By in situ hybridization to various human tissues, Schlingmann et al. (2002) observed TRPM6 mRNA in colon epithelial cells, duodenum, jejunum, and ileum. Schlingmann et al. (2002) studied 5 families (2 Turkish, 1 Swedish, 1 Israeli, and 1 Albanian) with typical HSH and discovered 7 mutations in the TRPM6 gene; the Swedish and Israeli families were nonconsanguineous and the affected children were compound heterozygotes for TRPM6 mutations. The age

at onset of symptoms varied from 3 weeks to 4 months. Neurologic symptoms included tetany, muscle spasms, and seizures due to hypomagnesemic hypocalcemia. Walder et al. (2002) identified mutations in the TRPM6 gene in 7 families: 3 Bedouin Arab families from Israel, 1 Arab family from Greece, a family in Germany, and 2 additional Arab families from Israel. This was the first case of a human disorder attributed to mutation in a channel kinase.

[1846]

[1847] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1848] Walder, R. Y.; Landau, D.; Meyer, P.; Shalev, H.; Tsolia, M.; Borochowitz, Z.; Boettger, M. B.; Beck, G. E.; Englehardt, R. K.; Carmi, R.; Sheffield, V. C. : Mutation of TRPM6 causes familial hypomagnesemia with secondary hypocalcemia. Nature Genet. 31: 171- 174, 2002. ; and

[1849] Schlingmann, K. P.; Weber, S.; Peters, M.; Nejsum, L. N.; Vitzthum, H.; Klingel, K.; Kratz, M.; Haddad, E.; Ristoff, E.; Dinour, D.; Syrrou, M.; Nielsen, S.; Sassen, M.; Waldegger, S.; S.

[1850] Further studies establishing the function and utilities of

TRPM6 are found in John Hopkins OMIM database record ID 607009, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tspy-like (TSPYL, Accession XP_166325.1) is another GAM25 target gene, herein designated TARGET GENE. TSPYL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TSPYL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TSPYL BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1851] Another function of GAM25 is therefore inhibition of Tspy-like (TSPYL, Accession XP_166325.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPYL.

[1852] TU12B1-TY (Accession NP_057659.1) is another GAM25 target gene, herein designated TARGET GENE. TU12B1-TY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TU12B1-TY, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:1130, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1853] Another function of GAM25 is therefore inhibition of TU12B1-TY (Accession NP_057659.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY.

[1854] TUCAN (Accession NP_055774.1) is another GAM25 target gene, herein designated TARGET GENE. TUCAN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUCAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:16692, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1855] Another function of GAM25 is therefore inhibition of TUCAN (Accession NP_055774.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TUCAN.

[1856] Ubiquitin specific protease 22 (USP22, Accession XP_042698.2) is another GAM25 target gene, herein designated TARGET GENE. USP22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP22 BINDING SITE, designated SEQ ID:18783, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1857] Another function of GAM25 is therefore inhibition of Ubiquitin specific protease 22 (USP22, Accession XP_042698.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP22.

[1858] VDU1 (Accession NP_055832.2) is another GAM25 target gene, herein designated TARGET GENE. VDU1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VDU1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VDU1 BIND-

ING SITE, designated SEQ ID:15118, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1859] Another function of GAM25 is therefore inhibition of VDU1 (Accession NP_055832.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDU1.

[1860] Vent-like homeobox 2 (VENTX2, Accession NP_055283.1) is another GAM25 target gene, herein designated TARGET GENE. VENTX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VENTX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VENTX2 BINDING SITE, designated SEQ ID:7014, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1861] Another function of GAM25 is therefore inhibition of Vent-like homeobox 2 (VENTX2, Accession NP_055283.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VENTX2.

[1862] Vacuolar protein sorting 33a (yeast) (VPS33A, Accession

NP_075067.2) is another GAM25 target gene, herein designated TARGET GENE. VPS33A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VPS33A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS33A BINDING SITE, designated SEQ ID:17693, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1863] Another function of GAM25 is therefore inhibition of Vacuolar protein sorting 33a (yeast) (VPS33A, Accession NP_075067.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS33A.

[1864] Williams beuren syndrome chromosome region 18 (WBSCR18, Accession NP_115693.2) is another GAM25 target gene, herein designated TARGET GENE. WBSCR18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WBSCR18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

WBSCR18 BINDING SITE, designated SEQ ID:6069, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1865] Another function of GAM25 is therefore inhibition of Williams beuren syndrome chromosome region 18 (WBSCR18, Accession NP_115693.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR18.

[1866] WBSCR20B (Accession NP_663620.1) is another GAM25 target gene, herein designated TARGET GENE. WBSCR20B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by WBSCR20B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR20B BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1867] Another function of GAM25 is therefore inhibition of WBSCR20B (Accession NP_663620.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR20B.

[1868] WBSCR20C (Accession NP_115534.2) is another GAM25 target gene, herein designated TARGET GENE. WBSCR20C BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by WBSCR20C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR20C BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1869] Another function of GAM25 is therefore inhibition of WBSCR20C (Accession NP_115534.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR20C.

[1870] WBSCR20C (Accession NP_683738.1) is another GAM25 target gene, herein designated TARGET GENE. WBSCR20C BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by WBSCR20C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of WBSCR20C BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1871] Another function of GAM25 is therefore inhibition of WBSCR20C (Accession NP_683738.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR20C.

[1872] WBSCR20C (Accession NP_683881.1) is another GAM25 target gene, herein designated TARGET GENE. WBSCR20C BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by WBSCR20C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR20C BINDING SITE, designated SEQ ID:4882, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1873] Another function of GAM25 is therefore inhibition of WBSCR20C (Accession NP_683881.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with WB-SCR20C.

[1874] Williams-beuren syndrome chromosome region 23 (WBSCR23, Accession NP_079318.1) is another GAM25 target gene, herein designated TARGET GENE. WBSCR23 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WBSCR23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:9809, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1875] Another function of GAM25 is therefore inhibition of Williams-beuren syndrome chromosome region 23 (WBSCR23, Accession NP_079318.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR23.

[1876] WFDC8 (Accession NP_852611.1) is another GAM25 target gene, herein designated TARGET GENE. WFDC8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WFDC8, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WFDC8 BINDING SITE, designated SEQ ID:11481, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1877] Another function of GAM25 is therefore inhibition of WFDC8 (Accession NP_852611.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WFDC8.

[1878] ZAP (Accession NP_064504.2) is another GAM25 target gene, herein designated TARGET GENE. ZAP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZAP BINDING SITE, designated SEQ ID:12540, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1879] Another function of GAM25 is therefore inhibition of ZAP (Accession NP_064504.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAP.

[1880] ZFP42 (Accession NP_777560.1) is another GAM25 target gene, herein designated TARGET GENE. ZFP42 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFP42, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP42 BINDING SITE, designated SEQ ID:14670, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1881] Another function of GAM25 is therefore inhibition of ZFP42 (Accession NP_777560.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP42.

[1882] Zinc finger protein 64 homolog (mouse) (ZFP64, Accession NP_060667.1) is another GAM25 target gene, herein designated TARGET GENE. ZFP64 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZFP64, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP64 BINDING SITE, designated SEQ ID:667, to the nucleotide

sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1883] Another function of GAM25 is therefore inhibition of Zinc finger protein 64 homolog (mouse) (ZFP64, Accession NP_060667.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP64.

[1884] Zinc finger protein 64 homolog (mouse) (ZFP64, Accession NP_071371.2) is another GAM25 target gene, herein designated TARGET GENE. ZFP64 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZFP64, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP64 BINDING SITE, designated SEQ ID:667, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1885] Another function of GAM25 is therefore inhibition of Zinc finger protein 64 homolog (mouse) (ZFP64, Accession NP_071371.2) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP64.

[1886] ZMYND17 (Accession NP_848546.1) is another GAM25 target gene, herein designated TARGET GENE. ZMYND17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZMYND17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZMYND17 BINDING SITE, designated SEQ ID:1129, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1887] Another function of GAM25 is therefore inhibition of ZMYND17 (Accession NP_848546.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZMYND17.

[1888] Zinc finger protein 264 (ZNF264, Accession NP_003408.1) is another GAM25 target gene, herein designated TARGET GENE. ZNF264 BINDING SITE1 and ZNF264 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ZNF264, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE1

and ZNF264 BINDING SITE2, designated SEQ ID:16732 and SEQ ID:3185 respectively, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1889] Another function of GAM25 is therefore inhibition of Zinc finger protein 264 (ZNF264, Accession NP_003408.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264.

[1890] Zinc finger protein 398 (ZNF398, Accession NP_065832.1) is another GAM25 target gene, herein designated TARGET GENE. ZNF398 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ZNF398, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF398 BINDING SITE, designated SEQ ID:13567, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1891] Another function of GAM25 is therefore inhibition of Zinc finger protein 398 (ZNF398, Accession NP_065832.1) . Accordingly, utilities of GAM25 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with ZNF398.

[1892] ZNF440 (Accession NP_689570.1) is another GAM25 target gene, herein designated TARGET GENE. ZNF440 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF440, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF440 BINDING SITE, designated SEQ ID:8954, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1893] Another function of GAM25 is therefore inhibition of ZNF440 (Accession NP_689570.1) . Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF440.

[1894] Zinc finger protein 70 (cos17) (ZNF70, Accession NP_068735.1) is another GAM25 target gene, herein designated TARGET GENE. ZNF70 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF70, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of ZNF70 BINDING SITE, designated SEQ ID:5829, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1895] Another function of GAM25 is therefore inhibition of Zinc finger protein 70 (cos17) (ZNF70, Accession NP_068735.1). Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF70.

[1896] Zinc finger protein 70 (cos17) (ZNF70, Accession NP_852101.1) is another GAM25 target gene, herein designated TARGET GENE. ZNF70 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF70, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF70 BINDING SITE, designated SEQ ID:5829, to the nucleotide sequence of GAM25 RNA, herein designated GAM RNA, also designated SEQ ID:206.

[1897] Another function of GAM25 is therefore inhibition of Zinc finger protein 70 (cos17) (ZNF70, Accession NP_852101.1). Accordingly, utilities of GAM25 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with ZNF70.

[1898]

[1899] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 28 (GAM28), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[1900] GAM28 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM28 was detected is described hereinabove with reference to Figs. 8-15.

[1901] GAM28 gene, herein designated GAM GENE, and GAM28 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[1902] GAM28 gene encodes a GAM28 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM28 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM28 precursor RNA is designated SEQ ID:141, and is provided hereinbelow with reference to the sequence list-

ing part. Nucleotide sequence SEQ ID:141 is located at position 54105760 relative to chromosome 12.

[1903] GAM28 precursor RNA folds onto itself, forming GAM28 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1904] GAM28 precursor RNA folds onto itself, forming GAM28 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[1905] Nucleotide sequence of GAM28 precursor RNA, designated SEQ-ID: 141, and a schematic representation of a predicted secondary folding of GAM28 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[1906] An enzyme complex designated DICER COMPLEX, `dices` the GAM28 folded precursor RNA into GAM28 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM28 RNA is designated SEQ ID:260, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[1907] GAM28 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM28 target RNA, herein designated GAM TARGET RNA. GAM28 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1908] GAM28 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM28 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM28 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM28 RNA may have a different number of target binding sites in untranslated regions of a GAM28 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1909] The complementary binding of GAM28 RNA, herein designated GAM RNA, to target binding sites on GAM28 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM28 target RNA into GAM28 target protein, herein designated GAM TARGET PROTEIN. GAM target

protein is therefore outlined by a broken line.

[1910] It is appreciated that GAM28 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM28 target genes. The mRNA of each one of this plurality of GAM28 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM28 RNA, herein designated GAM RNA, and which when bound by GAM28 RNA causes inhibition of translation of respective one or more GAM28 target proteins.

[1911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM28 gene, herein designated GAM GENE, on one or more GAM28 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[1912] It is appreciated that specific functions and accordingly utilities of GAM28 correlate with, and may be deduced from, the identity of the target genes which GAM28 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1913]

[1914]

[1915] Component of oligomeric golgi complex 3 (COG3, Accession NM_031431.2) is a GAM28 target gene, herein designated TARGET GENE. COG3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COG3 BINDING SITE, designated SEQ ID:8233, to the nucleotide sequence of GAM28 RNA, herein designated GAM RNA, also designated SEQ ID:260.

[1916] A function of GAM28 is therefore inhibition of Component of oligomeric golgi complex 3 (COG3, Accession

NM_031431.2), a gene which is critical for the structure and function of the Golgi apparatus. Accordingly, utilities of GAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COG3.

[1917] The function of COG3 has been established by previous studies. Multiprotein complexes are key determinants of Golgi apparatus structure and its capacity for intracellular transport and glycoprotein modification. Several complexes have been identified, including the Golgi transport complex (GTC), the LDLC complex, which is involved in glycosylation reactions, and the SEC34 complex, which is involved in vesicular transport. These 3 complexes are identical and have been termed the conserved oligomeric Golgi (COG) complex, which includes COG3 (Ungar et al., 2002). By SDS- PAGE analysis of bovine brain cytosol, Ungar et al. (2002) identified the 8 subunits of the COG complex. Immunofluorescence microscopy demonstrated that COG1 (LDLB; 606973) colocalizes with COG7 (OMIM Ref. No. 606978), as well as with COG3 and COG5 (OMIM Ref. No. 606821), with a Golgi marker in a perinuclear distribution. Immunoprecipitation analysis showed that all COG subunits interact with COG2 (LDLC; 606974). Ungar et al. (2002) concluded that the COG complex is critical

for the structure and function of the Golgi apparatus and can influence intracellular membrane trafficking

[1918]

[1919] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1920] Suvorova, E. S.; Kurten, R. C.; Lupashin, V. V. : Identification of a human orthologue of Sec34p as a component of the cis- Golgi vesicle tethering machinery. J. Biol. Chem. 276: 22810- 22818, 2001. ; and

[1921] Ungar, D.; Oka, T.; Brittle, E. E.; Vasile, E.; Lupashin, V. V.; Chatterton, J. E.; Heuser, J. E.; Krieger, M.; Waters, M. G. : Characterization of a mammalian Golgi- localized protein c.

[1922] Further studies establishing the function and utilities of COG3 are found in John Hopkins OMIM database record ID 606975, and in cited publications listed in Table 5, which are hereby incorporated by reference.Estrogen-related receptor beta like 1 (ESRRBL1, Accession NM_018010.2) is another GAM28 target gene, herein designated TARGET GENE. ESRRBL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ESRRBL1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ESRRBL1 BINDING SITE, designated SEQ ID:8766, to the nucleotide sequence of GAM28 RNA, herein designated GAM RNA, also designated SEQ ID:260.

[1923] Another function of GAM28 is therefore inhibition of Estrogen-related receptor beta like 1 (ESRRBL1, Accession NM_018010.2) . Accordingly, utilities of GAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRBL1.

[1924] KRT6IRS (Accession NM_033448.1) is another GAM28 target gene, herein designated TARGET GENE. KRT6IRS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRT6IRS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRT6IRS BINDING SITE, designated SEQ ID:4708, to the nucleotide sequence of GAM28 RNA, herein designated GAM RNA, also designated SEQ ID:260.

[1925] Another function of GAM28 is therefore inhibition of KRT6IRS (Accession NM_033448.1) . Accordingly, utilities of GAM28 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KRT6IRS.

[1926] Transducin (beta)-like 1x-linked (TBL1X, Accession NM_005647.2) is another GAM28 target gene, herein designated TARGET GENE. TBL1X BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBL1X, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:12893, to the nucleotide sequence of GAM28 RNA, herein designated GAM RNA, also designated SEQ ID:260.

[1927] Another function of GAM28 is therefore inhibition of Transducin (beta)-like 1x-linked (TBL1X, Accession NM_005647.2), a gene which activates latent HDAC3 activity. Accordingly, utilities of GAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X.

[1928] The function of TBL1X has been established by previous studies. In the course of constructing a deletion map of the distal portion of the short arm of the X chromosome and the identification of the OA1 gene (OMIM Ref. No. 300500), Bassi et al. (1999) performed cDNA selection experiments that resulted in the isolation of a novel gene,

TBL1, located outside the OA1 critical region on the telomeric side. The TBL1 gene maps to the Xp22.3 region and shares significant homology with members of the WD40 repeat- containing protein family. The open reading frame encodes a 526- amino acid protein containing 6 beta- transducin repeats (WD40 motif) in the C- terminal domain. The homology with known beta- subunits of G proteins and other WD40 repeat- containing proteins is restricted to the WD40 motif. Northern blot analysis indicated that the TBL1 gene is ubiquitously expressed as 2 transcripts of approximately 2.1 and 6.0 kb. Matsuzawa and Reed (2001) elucidated a network of protein interactions in which SIAH1 (OMIM Ref. No. 602212), SIP (OMIM Ref. No. 606186), SKP1 (OMIM Ref. No. 601434), and EBI collaborate in a pathway controlling beta- catenin (OMIM Ref. No. 116806) levels, affecting activity of beta-catenin- dependent TCF (e.g., TCF1; 142410) and LEF (e.g., LEF1; 153245) transcription factors. This pathway is inducible by p53 (OMIM Ref. No. 191170), revealing a link between genotoxic injury responses and beta- catenin degradation. SIAH1 is physically linked to EBI by association with SIP, which binds SKP1.

[1929]

[1930] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1931] Bassi, M. T.; Ramesar, R. S.; Caciotti, B.; Winship, I. M.; De Grandi, A.; Riboni, M.; Townes, P. L.; Beighton, P.; Ballabio, A.; Borsani, G. : X- linked late- onset sensorineural deafness caused by a deletion involving OA1 and a novel gene containing WD- 40 repeats. Am. J. Hum. Genet. 64: 1604-1616, 1999. ; and

[1932] Matsuzawa, S.; Reed, J. C. : Siah- 1, SIP, and Ebi collaborate in a novel pathway for beta- catenin degradation linked to p53 responses. Molec. Cell 7: 915- 926, 2001.

[1933] Further studies establishing the function and utilities of TBL1X are found in John Hopkins OMIM database record ID 300196, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[1934] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 29 (GAM29), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[1935] GAM29 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM29 was detected is described hereinabove with reference to Figs. 8-15.

[1936] GAM29 gene, herein designated GAM GENE, and GAM29 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[1937] GAM29 gene encodes a GAM29 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM29 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM29 precursor RNA is designated SEQ ID:81, and is provided hereinbelow with reference to the sequence listing part.

[1938] GAM29 precursor RNA folds onto itself, forming GAM29 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1939] GAM29 precursor RNA folds onto itself, forming GAM29 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[1940] Nucleotide sequence of GAM29 precursor RNA, designated SEQ-ID: 81, and a schematic representation of a predicted secondary folding of GAM29 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[1941] An enzyme complex designated DICER COMPLEX, `dices` the GAM29 folded precursor RNA into GAM29 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM29 RNA is designated SEQ

ID:380, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[1942] GAM29 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM29 target RNA, herein designated GAM TARGET RNA. GAM29 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1943] GAM29 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM29 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM29 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM29 RNA may have a different number of target

binding sites in untranslated regions of a GAM29 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1944] The complementary binding of GAM29 RNA, herein designated GAM RNA, to target binding sites on GAM29 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM29 target RNA into GAM29 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[1945] It is appreciated that GAM29 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM29 target genes. The mRNA of each one of this plurality of GAM29 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM29 RNA, herein designated GAM RNA, and which when bound by GAM29 RNA causes inhibition of translation of respective one or more GAM29 target proteins.

[1946] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM29 gene, herein designated GAM GENE, on one or more GAM29 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[1947] It is appreciated that specific functions and accordingly utilities of GAM29 correlate with, and may be deduced from, the identity of the target genes which GAM29 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1948]

[1949]

[1950] KIAA0222 (Accession NM_014643.1) is a GAM29 target gene, herein designated TARGET GENE. KIAA0222 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0222, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0222 BINDING SITE, designated SEQ ID:11419, to the nucleotide sequence of GAM29 RNA, herein designated GAM RNA, also designated SEQ ID:380.

[1951] A function of GAM29 is therefore inhibition of KIAA0222 (Accession NM_014643.1) . Accordingly, utilities of GAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0222.

[1952] LOC254778 (Accession) is another GAM29 target gene, herein designated TARGET GENE. LOC254778 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254778, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:8734, to the

nucleotide sequence of GAM29 RNA, herein designated GAM RNA, also designated SEQ ID:380.

[1953] Another function of GAM29 is therefore inhibition of LOC254778 (Accession) . Accordingly, utilities of GAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778.

[1954]

[1955] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 30 (GAM30), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[1956] GAM30 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM30 was detected is described hereinabove with reference to Figs. 8-15.

[1957] GAM30 gene, herein designated GAM GENE, and GAM30 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[1958] GAM30 gene encodes a GAM30 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM30 precursor

RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM30 precursor RNA is designated SEQ ID:125, and is provided hereinbelow with reference to the sequence listing part.

[1959] GAM30 precursor RNA folds onto itself, forming GAM30 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1960] GAM30 precursor RNA folds onto itself, forming GAM30 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[1961] Nucleotide sequence of GAM30 precursor RNA, designated SEQ-ID: 125, and a schematic representation of a predicted secondary folding of GAM30 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[1962] An enzyme complex designated DICER COMPLEX, `dices` the GAM30 folded precursor RNA into GAM30 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM30 RNA is designated SEQ ID:346, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[1963] GAM30 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM30 target RNA, herein designated GAM TARGET RNA. GAM30 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[1964] GAM30 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM30 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM30 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM30 RNA may have a different number of target binding sites in untranslated regions of a GAM30 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1965] The complementary binding of GAM30 RNA, herein designated GAM RNA, to target binding sites on GAM30 target RNA, herein designated GAM TARGET RNA, such as BIND-

ING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM30 target RNA into GAM30 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[1966] It is appreciated that GAM30 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM30 target genes. The mRNA of each one of this plurality of GAM30 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM30 RNA, herein designated GAM RNA, and which when bound by GAM30 RNA causes inhibition of translation of respective one or more GAM30 target proteins.

[1967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM30 gene, herein designated GAM GENE, on one or more GAM30 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[1968] It is appreciated that specific functions and accordingly utilities of GAM30 correlate with, and may be deduced from, the identity of the target genes which GAM30 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1969]

[1970]

[1971] Aryl hydrocarbon receptor (AHR, Accession NM_001621.2) is a GAM30 target gene, herein designated TARGET GENE. AHR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AHR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:10227, to the nucleotide sequence of GAM30 RNA, herein designated GAM

RNA, also designated SEQ ID:346.

[1972] A function of GAM30 is therefore inhibition of Aryl hydrocarbon receptor (AHR, Accession NM_001621.2), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic- metabolizing enzymes and therefore may be associated with Stomach tumors. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Stomach tumors, and of other diseases and clinical conditions associated with AHR.

[1973] The function of AHR has been established by previous studies. Halogenated aromatic hydrocarbons, represented by 2,3,7,8- tetrachlorodibenzo- p- dioxin (TCDD), are environmental pollutants that are produced by minor side- reactions in chemical manufacturing processes and by combustion of waste materials. These chemicals cause potent and pleiotropic toxicity, including teratogenesis, immune suppression, epithelial disorders, and tumor production in experimental animals. At the molecular level, aldehyde dehydrogenase, quinone reductase, and various drug- metabolizing enzymes are induced by the chemicals in some cultured cells and some tissues of experimental animals. All these biologic effects are thought to be mediated by an intracellular aryl hydrocarbon receptor

(AHR). By fluorescence in situ hybridization and by DNA blot hybridization using human/mouse or human/Chinese hamster hybrid cell DNAs, Ema et al. (1994) assigned the AHR gene to 7p21. By use of PCR analysis of somatic cell hybrids and fluorescence in situ hybridization of metaphase cells, Le Beau et al. (1994) localized the AHR gene to 7p21- p15. Micka et al. (1997) localized the AHR gene to 7p15 using fluorescence in situ hybridization. Performing linkage analysis in a 3- generation family, they showed with good probability that the high CYP1A1 (OMIM Ref. No. 108330) inducibility phenotype segregates with the 7p15 region.

[1974] Animal model experiments lend further support to the function of AHR. To determine whether the aryl hydrocarbon receptor plays a role in modulating carcinogenesis through the induction of xenobiotic- metabolizing enzymes, Shimizu et al. (2000) studied Ahr- deficient mice exposed to benzo(a)pyrene, a widely distributed environmental carcinogen.

[1975] It is appreciated that the abovementioned animal model for AHR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[1976] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1977] Ema, M.; Matsushita, N.; Sogawa, K.; Ariyama, T.; Inazawa, J.; Nemoto, T.; Ota, M.; Oshimura, M.; Fujii- Kuriyama, Y. : Human arylhydrocarbon receptor: functional expression and chromosomal assignment to 7p21. J. Biochem. 116: 845- 851, 1994. ; and

[1978] Shimizu, Y.; Nakatsuru, Y.; Ichinose, M.; Takahashi, Y.; Kume, H.; Mimura, J.; Fujii- Kuriyama, Y.; Ishikawa, T. : Benzo[a]pyrene carcinogenicity is lost in mice lacking the aryl hydrocar.

[1979] Further studies establishing the function and utilities of AHR are found in John Hopkins OMIM database record ID 600253, and in cited publications listed in Table 5, which are hereby incorporated by reference.Apoptotic protease activating factor (APAF1, Accession NM_013229.1) is another GAM30 target gene, herein designated TARGET GENE. APAF1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APAF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of APAF1 BINDING SITE, designated SEQ ID:8324, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[1980] Another function of GAM30 is therefore inhibition of Apoptotic protease activating factor (APAF1, Accession NM_013229.1), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3 and therefore may be associated with Cancer. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with APAF1.

[1981] The function of APAF1 has been established by previous studies. Metastatic melanoma is a deadly cancer that fails to respond to conventional chemotherapy. Mutations in p53 (OMIM Ref. No. 191170) often occur in aggressive and chemoresistant cancers but are rarely observed in melanoma. Soengas et al. (2001) showed that metastatic melanomas often lose APAF1. Loss of APAF1 expression was accompanied by allelic loss in metastatic melanomas, but could be recovered in melanoma cell lines by treatment with the methylation inhibitor 5- aza- 2- prime- deoxycytidine (5aza2dC). APAF1- negative melanomas

were invariably chemoresistant and were unable to execute a typical apoptotic program in response to p53 activation. Restoring physiologic levels of APAF1 through gene transfer or 5aza2dC treatment markedly enhanced chemosensitivity and rescued the apoptotic defects associated with APAF1 loss. Soengas et al. (2001) concluded that APAF1 is inactivated in metastatic melanomas, leading to defects in the execution of apoptotic cell death.

[1982] Animal model experiments lend further support to the function of APAF1. Yoshida et al. (1998) also produced Apaf1- deficient mice which exhibited reduced apoptosis in the brain and striking craniofacial abnormalities with hyperproliferation of neuronal cells. Apaf1- deficient cells were resistant to a variety of apoptotic stimuli, and the processing of caspases- 2, - 3, and - 8 was impaired. However, both Apaf1 - /- thymocytes and activated T lymphocytes were sensitive to Fas- induced killing, showing that Fas- mediated apoptosis in these cells is independent of Apaf1. These data indicated that Apaf1 plays a central role in the common events of mitochondria- dependent apoptosis in most death pathways and that this role is critical for normal development.

[1983] It is appreciated that the abovementioned animal model

for APAF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[1984] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1985] Soengas, M. S.; Capodieci, P.; Polsky, D.; Mora, J.; Esteller, M.; Opitz- Araya, X.; McCombie, R.; Herman, J. G.; Gerald, W. L.; Lazebnik, Y. A.; Cordon- Cardo, C.; Lowe, S. W. : Inactivation of the apoptosis effector Apaf- 1 in malignant melanoma. Nature 409: 207- 211, 2001. ; and

[1986] Yoshida, H.; Kong, Y.- Y.; Yoshida, R.; Elia, A. J.; Hakem, A.; Hakem, R.; Penninger, J. M.; Mak, T. W. : Apaf1 is required for mitochondrial pathways of apoptosis and brain development.

[1987] Further studies establishing the function and utilities of APAF1 are found in John Hopkins OMIM database record ID 602233, and in cited publications listed in Table 5, which are hereby incorporated by reference.APM1 (Accession NM_004797.1) is another GAM30 target gene, herein designated TARGET GENE. APM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APM1, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:11325, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[1988] Another function of GAM30 is therefore inhibition of APM1 (Accession NM_004797.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[1989] Apolipoprotein l, 1 (APOL1, Accession NM_145343.1) is another GAM30 target gene, herein designated TARGET GENE. APOL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:19014, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[1990] Another function of GAM30 is therefore inhibition of Apolipoprotein l, 1 (APOL1, Accession NM_145343.1), a

gene which may participate in reverse cholesterol transport from peripheral cells to the liver. and therefore may be associated with Schizophrenia. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Schizophrenia, and of other diseases and clinical conditions associated with APOL1.

[1991] The function of APOL1 has been established by previous studies. By genomic sequence analysis, Page et al. (2001) identified APOL1 within the APOL gene cluster. The predicted 398- amino acid protein has a calculated molecular mass of 43.9 kD. They noted that the APOL proteins share significant identity within the predicted amphipathic alpha helices. Semiquantitative RT- PCR revealed ubiquitous expression of APOL1, with highest levels in lung, spleen, prostate, and placenta, and weak expression in fetal brain and pancreas. In situ hybridization of human placenta revealed expression in all 3 tissue layers, including the basal plate, cytiotrophoblast, and chorionic plate. In a microarray analysis of gene expression in the prefrontal cortex of schizophrenia (OMIM Ref. No. 181500) and control brains, Mimmack et al. (2002) found significant upregulation of the APOL1, APOL2 (OMIM Ref. No. 607252), and APOL4 (OMIM Ref. No. 607254) genes.

[1992]

[1993] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1994] Mimmack, M. L.; Ryan, M.; Baba, H.; Navarro- Ruiz, J.; Iritani, S.; Faull, R. L. M.; McKenna, P. J.; Jones, P. B.; Arai, H.; Starkey, M.; Emson, P. C.; Bahn, S. : Gene expression analysis in schizophrenia: reproducible up- regulation of several members of the apolipoprotein L family located in a high- susceptibility locus for schizophrenia on chromosome 22. Proc. Nat. Acad. Sci. 99: 4680- 4685, 2002. ; and

[1995] Page, N. M.; Butlin, D. J.; Lomthaisong, K.; Lowry, P. J. : The human apolipoprotein L gene cluster: identification, classification, and sites of distribution. Genomics 74: 71-78, 200.

[1996] Further studies establishing the function and utilities of APOL1 are found in John Hopkins OMIM database record ID 603743, and in cited publications listed in Table 5, which are hereby incorporated by reference.Archain 1 (ARCN1, Accession NM_001655.3) is another GAM30 target gene, herein designated TARGET GENE. ARCN1 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by ARCN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:19563, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[1997] Another function of GAM30 is therefore inhibition of Ar- chain 1 (ARCN1, Accession NM_001655.3), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1.

[1998] The function of ARCN1 has been established by previous studies. Radice et al. (1995) identified a gene that maps approximately 50- kb telomeric to MLL (OMIM Ref. No. 159555) in band 11q23.3, a locus disrupted in certain leukemia- associated translocation chromosomes. A 200- kb genomic fragment from a YAC that includes MLL was used to screen a cDNA library of the R54;11 cell line which carries a translocation chromosome t(4;11)(q21; q23). The cDNA sequence predicts a 511- amino acid protein which shares similarity with predicted proteins of unknown

function from rice (Oryza sativa) and Drosophila. Because of this ancient conservation the authors proposed the name archain (ARCN1). Radice et al. (1995) detected 4- kb ARCN1 transcripts by Northern blot analysis in all tissues examined. The protein encoded by the ARCN1 gene, the coatomer protein delta- COP, probably plays a fundamental role in eukaryotic cell biology. Tunnacliffe at al. (1996)demonstrated that it is conserved across diverse eukaryotes. Very close or identical matches were seen in rat and cow; highly significant matches were seen with 2 plant species, A. thaliana (cress) and S. tuberosum (OMIM Ref. No. potato). Of particular biologic significance was the match with a sequence on yeast chromosome VI, from which Tunnacliffe et al. (1996) were able to determine the yeast archain gene and protein sequence. Unpublished data indicated that in situ hybridizations on mouse embryo sections showed archain transcripts throughout the whole animal.

[1999]

[2000] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2001] Radice, P.; Pensotti, V.; Jones, C.; Perry, H.; Pierotti, M. A.;

Tunnacliffe, A. : The human archain gene, ARCN1, has highly conserved homologs in rice and Drosophila. Genomics 26: 101- 106, 1995. ; and

[2002] Tunnacliffe, A.; van de Vrugt, H.; Pensotti, V.; Radice, P. : The coatomer protein delta- COP, encoded by the archain gene, is conserved across diverse eukaryotes. Mammalian Genome 7: 78.

[2003] Further studies establishing the function and utilities of ARCN1 are found in John Hopkins OMIM database record ID 600820, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ras homolog gene family, member f (in filopodia) (ARHF, Accession NM_019034.1) is another GAM30 target gene, herein designated TARGET GENE. ARHF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHF BINDING SITE, designated SEQ ID:11167, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2004] Another function of GAM30 is therefore inhibition of Ras homolog gene family, member f (in filopodia) (ARHF, Ac-

cession NM_019034.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHF.

[2005] ARHGAP11A (Accession NM_014783.1) is another GAM30 target gene, herein designated TARGET GENE. ARHGAP11A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ARHGAP11A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGAP11A BINDING SITE, designated SEQ ID:13439, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2006] Another function of GAM30 is therefore inhibition of ARHGAP11A (Accession NM_014783.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP11A.

[2007] Ankyrin repeat and socs box-containing 16 (ASB16, Accession NM_080863.4) is another GAM30 target gene, herein designated TARGET GENE. ASB16 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by ASB16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:16342, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2008] Another function of GAM30 is therefore inhibition of Ankyrin repeat and socs box-containing 16 (ASB16, Accession NM_080863.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16.

[2009] BA108L7.2 (Accession NM_030971.1) is another GAM30 target gene, herein designated TARGET GENE. BA108L7.2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BA108L7.2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:15814, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2010] Another function of GAM30 is therefore inhibition of

BA108L7.2 (Accession NM_030971.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2.

[2011] Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession NM_007048.2) is another GAM30 target gene, herein designated TARGET GENE. BTN3A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BTN3A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:1769, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2012] Another function of GAM30 is therefore inhibition of Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession NM_007048.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1.

[2013] BY55 (Accession NM_007053.1) is another GAM30 target gene, herein designated TARGET GENE. BY55 BINDING SITE is a target binding site found in the 5` untranslated

region of mRNA encoded by BY55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BY55 BINDING SITE, designated SEQ ID:3163, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2014] Another function of GAM30 is therefore inhibition of BY55 (Accession NM_007053.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BY55.

[2015] Chromosome 22 open reading frame 19 (C22orf19, Accession NM_003678.2) is another GAM30 target gene, herein designated TARGET GENE. C22orf19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C22orf19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:2557, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2016] Another function of GAM30 is therefore inhibition of

Chromosome 22 open reading frame 19 (C22orf19, Accession NM_003678.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19.

[2017] Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NM_033332.1) is another GAM30 target gene, herein designated TARGET GENE. CDC14B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:1166, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2018] Another function of GAM30 is therefore inhibition of Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NM_033332.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B.

[2019] Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NM_004360.2) is another GAM30 target gene, herein designated TARGET GENE. CDH1 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:8905, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2020] Another function of GAM30 is therefore inhibition of Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NM_004360.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1.

[2021] Coronin, actin binding protein, 2b (CORO2B, Accession NM_006091.1) is another GAM30 target gene, herein designated TARGET GENE. CORO2B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CORO2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:9083, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2022] Another function of GAM30 is therefore inhibition of Coronin, actin binding protein, 2b (CORO2B, Accession NM_006091.1), a gene which may play a role in the reorganization of neuronal actin structure. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2B.

[2023] The function of CORO2B has been established by previous studies. The Dictyostelium actin- binding protein coronin accumulates at the leading edges of motile cells and in crown- shaped extensions on the dorsal cell surface. Coronin is involved in cell motility, cytokinesis, and phagocytosis, all of which depend on cytoskeletal rearrangement; see CORO1A (OMIM Ref. No. 605000). By screening a frontal cortex cDNA library with a brain- enriched clone showing similarity to Dictyostelium coronin, Nakamura et al. (1999) isolated a full- length cDNA encoding CORO2B, which they called CLIPINC. The predicted 475- amino acid CORO2B protein has an N- terminal domain containing 5 WD repeats and a succeeding domain with a tendency to form alpha helices. Northern blot analysis detected abundant expression of an approximately 4.0- kb CORO2B transcript in brain, with moderate ex-

pression in heart and ovary, and little or no expression in other tissues tested. In contrast, CORO1A is primarily expressed in immune system tissues, and CORO2A (OMIM Ref. No. 602159) is predominantly expressed in colon, prostate, and testis. Immunohistochemical analysis revealed Coro2a expression in mouse cerebral cortex, hippocampus, thalamus, olfactory bulb, and cerebellum, as well as in the inner nuclear layer of embryonic retina and embryonic olfactory bulb. Cosedimentation analysis demonstrated that CORO2B associates with F- actin. Immunofluorescence analysis indicated that CORO2B accumulates at neurite tips, at focal adhesions in association with VCL (OMIM Ref. No. 193065), and along stress fibers.

[2024]

[2025] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2026] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hirosawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XIII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 6: 63- 70, 1999. ; and

[2027] Nakamura, T.; Takeuchi, K.; Muraoka, S.; Takezoe, H.; Takahashi, N.; Mori, N. : A neurally enriched coronin- like protein, ClipnC, is a novel candidate for an actin cytoskeleton- cortical.

[2028] Further studies establishing the function and utilities of CORO2B are found in John Hopkins OMIM database record ID 605002, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession NM_000761.2) is another GAM30 target gene, herein designated TARGET GENE. CYP1A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP1A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE, designated SEQ ID:12133, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2029] Another function of GAM30 is therefore inhibition of Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession NM_000761.2), a gene which intervenes in an NADPH-

dependent electron transport pathway. and therefore may be associated with Porphyria cutanea tarda. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Porphyria cutanea tarda, and of other diseases and clinical conditions associated with CYP1A2.

[2030] The function of CYP1A2 has been established by previous studies. P1- 450 (CYP1A1; 108330) and P3- 450 are 2 members of the dioxin- inducible P450 gene family. Jaiswal et al. (1987) determined the cDNA (3,064 bp) and protein (515 residues; M(r) = 58,294) sequences of P3-450. They showed by study of somatic cell hybrids that both the P3- 450 and the P1- 450 loci reside on human chromosome 15. In the mouse and hamster, the 2 genes are located near the equivalent of the mannosephosphate isomerase (MPI) locus (OMIM Ref. No. 154550). The same may be true in man; MPI is located in the region 15q22-qter. The 2 CYP1 genes are within 25 kb of each other and probably are not separated by other genes (Nebert, 1988). The enzyme involved in O- deethylation of phenacetin is 1 of 9 forms of cytochrome P- 450 that have been purified to electrophoretic homogeneity from human liver microsomes (Guengerich et al., 1986). Phenacetin O- deethylase differs from another cytochrome P- 450 enzyme that

shows genetic polymorphism, debrisoquine 4- hydroxylase (OMIM Ref. No. 124030), in molecular mass, amino acid composition, catalytic activity, and immunochemical properties. Butler et al. (1989) reviewed the evidence that phenacetin O- deethylase, otherwise known as P450(PA), is the product of the CYP1A2 gene. Devonshire et al. (1983) demonstrated a genetic polymorphism for phenacetin O- deethylation, with 5 to 10% of the population deficient in this activity. Cigarette smoking has been shown to increase microsomal phenacetin O- deethylase activity (Sesardic et al., 1988). Butler et al. (1989) reported that human hepatic microsomal caffeine 3- demethylation, the initial major step in caffeine biotransformation in humans, is selectively catalyzed by this cytochrome P-450. Estimation of caffeine 3- demethylation activity in humans may be useful in the characterization of arylamine N- oxidation phenotypes and in the assessment of whether or not the hepatic levels of this cytochrome, as affected by environmental or genetic factors, contribute to interindividual differences in susceptibility to arylamine-induced cancers. Smokers have been demonstrated to have increased rates of caffeine disposition, with plasma half lives one- half that of nonsmokers. Furthermore,

rates of caffeine metabolism vary between individuals, as caffeine half- life values ranging from 1.5 to 9.5 hours have been reported. Buters et al. (1996) showed that in mice the clearance of caffeine is determined primarily by CYP1A2.

[2031]

[2032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2033] Butler, M. A.; Iwasaki, M.; Guengerich, F. P.; Kadlubar, F. F. : Human cytochrome P- 450(PA) (P- 450IA2), the phenacetin O- deethylase, is primarily responsible for the hepatic 3- demethylation of caffeine and N- oxidation of carcinogenic arylamines. Proc. Nat. Acad. Sci. 86: 7696-7700, 1989. ; and

[2034] Christiansen, L.; Bygum, A.; Jensen, A.; Thomsen, K.; Brandrup, F.; Horder, M.; Petersen, N. E. : Association be-tween CYP1A2 polymorphism and susceptibility to por-phyria cutanea tarda.

[2035] Further studies establishing the function and utilities of CYP1A2 are found in John Hopkins OMIM database record ID 124060, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cytochrome

p450, subfamily iib (phenobarbital-inducible), polypeptide 6 (CYP2B6, Accession NM_000767.3) is another GAM30 target gene, herein designated TARGET GENE. CYP2B6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP2B6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP2B6 BINDING SITE, designated SEQ ID:19432, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2036] Another function of GAM30 is therefore inhibition of Cytochrome p450, subfamily iib (phenobarbital-inducible), polypeptide 6 (CYP2B6, Accession NM_000767.3), a gene which oxidizes a variety of structurally unrelated compounds, including steroids, fatty acids, and xenobiotics. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2B6.

[2037] The function of CYP2B6 has been established by previous studies. Thum and Borlak (2000) investigated the gene expression of major human cytochrome P450 genes in various regions of explanted hearts from 6 patients with

dilated cardiomyopathy and 1 with transposition of the arterial trunk and 2 samples of normal heart. mRNA for cytochrome 2B6 was predominantly expressed in the right ventricle. A strong correlation between tissue- specific gene expression and enzyme activity was found. Thum and Borlak (2000) concluded that their findings showed that expression of genes for cytochrome P450 monooxgenases and verapamil metabolism are found predominantly in the right side of the heart, and suggested that this observation may explain the lack of efficacy of certain cardioselective drugs. Using a cloned cDNA that codes for a human ortholog of the phenobarbital- inducible cytochrome P450IIB subfamily in rodents, Santisteban et al. (1988) localized the CYP2B gene family to 19cen- q13.3 by Southern blot hybridization to DNA extracted from a panel of human- rodent somatic cell hybrids. Miles et al. (1988) established the chromosomal localization of the CYP2B gene subfamily to be 19q12- q13.2, close to the location of CYP2A (OMIM Ref. No. 123960), by Southern blot analysis of human- rodent somatic cell hybrids.

[2038]

[2039] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[2040] Santisteban, I.; Povey, S.; Shephard, E. A.; Phillips, I. R. : The major phenobarbital- inducible cytochrome P- 450 gene subfamily (P450IIB) mapped to the long arm of human chromosome 19. Ann. Hum. Genet. 52: 129- 135, 1988. ; and

[2041] Thum, T.; Borlak, J. : Gene expression in distinct regions of the heart. Lancet 355: 979- 983, 2000.

[2042] Further studies establishing the function and utilities of CYP2B6 are found in John Hopkins OMIM database record ID 605059, and in cited publications listed in Table 5, which are hereby incorporated by reference.Debranching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NM_016216.1) is another GAM30 target gene, herein designated TARGET GENE. DBR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DBR1 BINDING SITE, designated SEQ ID:13182, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2043] Another function of GAM30 is therefore inhibition of De-

branching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NM_016216.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBR1.

[2044] DCOHM (Accession NM_032151.2) is another GAM30 target gene, herein designated TARGET GENE. DCOHM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:5214, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2045] Another function of GAM30 is therefore inhibition of DCOHM (Accession NM_032151.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM.

[2046] DKFZP434C212 (Accession XM_044196.4) is another GAM30 target gene, herein designated TARGET GENE. DKFZP434C212 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434C212, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:19580, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2047] Another function of GAM30 is therefore inhibition of DKFZP434C212 (Accession XM_044196.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212.

[2048] DKFZp761N1114 (Accession XM_086327.6) is another GAM30 target gene, herein designated TARGET GENE. DKFZp761N1114 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:1969, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2049] Another function of GAM30 is therefore inhibition of DK-

FZp761N1114 (Accession XM_086327.6) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N1114.

[2050] Desmocollin 3 (DSC3, Accession NM_001941.2) is another GAM30 target gene, herein designated TARGET GENE. DSC3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DSC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE, designated SEQ ID:17152, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2051] Another function of GAM30 is therefore inhibition of Desmocollin 3 (DSC3, Accession NM_001941.2), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3.

[2052] The function of DSC3 has been established by previous studies. From a bladder carcinoma cell line cDNA library, Kawamura et al. (1994) cloned a human cDNA encoding

for a novel transmembrane protein. Sequence analysis revealed an open reading frame of 2,691 bp encoding a protein of 896 amino acids. Sequence comparisons showed significant homology to desmocollins, intercellular adhesion molecules belonging to the cadherin superfamily. The protein consisted of a signal peptide of 30 amino acids, a precursor segment of 105 amino acids, and a mature protein of 761 amino acids. Antibodies recognizing the predicted mature adhesion molecule of the protein stained antigens along the cell boundaries of normal human keratinocytes resembling the pattern of desmosome localization. Kawamura et al. (1994) concluded that the clone represented a new member of the desmocollin family and tentatively referred to it as desmocollin type 4. King et al. (1995) used the designation DSC3 for a gene encoding a desmocollin present in human foreskin epidermis and stated that the gene is identical to that encoding the desmocollin isolated from a bladder carcinoma cell line and called DSC4 by Kawamura et al. (1994). They likewise mapped the gene to chromosome 18 by PCR analysis of rodent/human somatic cell hybrids. They stated that the cDNA sequence showed 67% amino acid identity with the original human desmocollin,

designated DSC2, and 52% amino acid identity with DSC1. By in situ hybridization studies, they showed that DSC1 was not present in any of the nonkeratinizing human epithelia, such as buccal mucosa, cervix, and esophagus, whereas all these internal epithelia expressed DSC2 and DSC3 and were present in most of the living layers of tissues, including the basal layers.

[2053]

[2054] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2055] Kawamura, K.; Watanabe, K.; Suzuki, T.; Yamakawa, T.; Kamiyama, T.; Nakagawa, H.; Tsurufuji, S. : cDNA cloning and expression of a novel human desmocollin. J. Biol. Chem. 269: 26295- 26302, 1994. ; and

[2056] King, I. A.; Sullivan, K. H.; Bennett, R., Jr.; Buxton, R. S. : The desmocollins of human foreskin epidermis: identification and chromosomal assignment of a third gene and expression p.

[2057] Further studies establishing the function and utilities of DSC3 are found in John Hopkins OMIM database record ID 600271, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ecotropic viral inte-

gration site 5 (EVI5, Accession NM_005665.2) is another GAM30 target gene, herein designated TARGET GENE. EVI5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12844, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2058] Another function of GAM30 is therefore inhibition of Ecotropic viral integration site 5 (EVI5, Accession NM_005665.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5.

[2059] Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NM_005103.3) is another GAM30 target gene, herein designated TARGET GENE. FEZ1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FEZ1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:14745, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2060] Another function of GAM30 is therefore inhibition of Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NM_005103.3), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC- 76. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1.

[2061] The function of FEZ1 has been established by previous studies. Ishii et al. (1999) positionally cloned and characterized the FEZ1/LZTS1 (leucine zipper, putative tumor suppressor- 1) gene at 8p22, a region that is lost in many tumors, including prostate, breast, head and neck,

esophageal, and urinary bladder carcinomas. The predicted FEZ1 protein contained a leucine- zipper region with similarity to the DNA- binding domain of the cAMP-responsive activating transcription factor- 5 (OMIM Ref. No. 606398). Northern blot analysis revealed that FEZ2 is expressed almost ubiquitously in normal tissues, although expression is most abundant in testes. FEZ1 expression was undetectable in more than 60% of epithelial tumors, but FEZ1 mutations were found in primary esophageal cancers and in a prostate cancer cell line. Transcript analysis from several FEZ1- expressing tumors revealed truncated mRNAs, including a frameshift. Alteration and inactivation of the FEZ1 gene may play a role in various human tumors. Ishii et al. (2001) showed that introduction of FEZ1/LZTS1 into FEZ1/LZTS1- negative cancer cells resulted in suppression of tumorigenicity and reduced cell growth with accumulation of cells at late S- G2/M stage of the cell cycle. Their data showed that FEZ1/LZTS1 inhibits cancer cell growth through regulation of mitosis, and that its alterations result in abnormal cell growth. Ishii et al. (1999) analyzed the nucleotide sequence of the FEZ1 gene open reading frame in 194 cancers, including 72 primary esophageal cancers. They found a point mutation in 2 pri-

mary esophageal cancers and in a prostate cancer cell line.

[2062]

[2063] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2064] Ishii, H.; Baffa, R.; Numata, S.- I.; Murakumo, Y.; Rattan, S.; Inoue, H.; Mori, M.; Fidanza, V.; Alder, H.; Croce, C. M. : The FEZ1 gene at chromosome 8p22 encodes a leucine-zipper protein, and its expression is altered in multiple human tumors. Proc. Nat. Acad. Sci. 96: 3928- 3933, 1999. ; and

[2065] Ishii, H.; Vecchione, A.; Murakumo, Y.; Baldassarre, G.; Numata, S.; Trapasso, F.; Alder, H.; Baffa, R.; Croce, C. M. : FEZ1/LZTS1 gene at 8p22 suppresses cancer cell growth and regula.

[2066] Further studies establishing the function and utilities of FEZ1 are found in John Hopkins OMIM database record ID 606551, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10101 (Accession NM_024718.1) is another GAM30 target gene, herein designated TARGET GENE. FLJ10101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by FLJ10101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10101 BINDING SITE, designated SEQ ID:8594, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2067] Another function of GAM30 is therefore inhibition of FLJ10101 (Accession NM_024718.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10101.

[2068] FLJ10232 (Accession NM_018033.1) is another GAM30 target gene, herein designated TARGET GENE. FLJ10232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10232 BINDING SITE, designated SEQ ID:1399, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2069] Another function of GAM30 is therefore inhibition of FLJ10232 (Accession NM_018033.1) . Accordingly, utilities

of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10232.

[2070] FLJ10297 (Accession) is another GAM30 target gene, herein designated TARGET GENE. FLJ10297 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10297 BINDING SITE, designated SEQ ID:2525, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2071] Another function of GAM30 is therefore inhibition of FLJ10297 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10297.

[2072] FLJ13072 (Accession XM_117117.2) is another GAM30 target gene, herein designated TARGET GENE. FLJ13072 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ13072, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ13072 BINDING SITE, designated SEQ ID:17545, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2073] Another function of GAM30 is therefore inhibition of FLJ13072 (Accession XM_117117.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072.

[2074] FLJ13456 (Accession XM_038291.5) is another GAM30 target gene, herein designated TARGET GENE. FLJ13456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:4252, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2075] Another function of GAM30 is therefore inhibition of FLJ13456 (Accession XM_038291.5) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456.

[2076] FLJ14803 (Accession NM_032842.1) is another GAM30 target gene, herein designated TARGET GENE. FLJ14803

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:9230, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2077] Another function of GAM30 is therefore inhibition of FLJ14803 (Accession NM_032842.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803.

[2078] FLJ20147 (Accession NM_017687.1) is another GAM30 target gene, herein designated TARGET GENE. FLJ20147 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20147 BINDING SITE, designated SEQ ID:1636, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2079] Another function of GAM30 is therefore inhibition of

FLJ20147 (Accession NM_017687.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20147.

[2080] FLJ20344 (Accession NM_017776.1) is another GAM30 target gene, herein designated TARGET GENE. FLJ20344 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20344, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20344 BINDING SITE, designated SEQ ID:3352, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2081] Another function of GAM30 is therefore inhibition of FLJ20344 (Accession NM_017776.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20344.

[2082] FLJ23024 (Accession NM_014150.1) is another GAM30 target gene, herein designated TARGET GENE. FLJ23024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:13913, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2083] Another function of GAM30 is therefore inhibition of FLJ23024 (Accession NM_014150.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024.

[2084] FLJ32894 (Accession NM_144667.1) is another GAM30 target gene, herein designated TARGET GENE. FLJ32894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32894 BINDING SITE, designated SEQ ID:16385, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2085] Another function of GAM30 is therefore inhibition of FLJ32894 (Accession NM_144667.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32894.

[2086] Fucosyltransferase 1 (galactoside

2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NM_000148.1) is another GAM30 target gene, herein designated TARGET GENE. FUT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT1 BINDING SITE, designated SEQ ID:18831, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2087] Another function of GAM30 is therefore inhibition of Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NM_000148.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT1.

[2088] GMPPB (Accession NM_021971.1) is another GAM30 target gene, herein designated TARGET GENE. GMPPB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GMPPB, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:4133, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2089] Another function of GAM30 is therefore inhibition of GMPPB (Accession NM_021971.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB.

[2090] Glycoprotein v (platelet) (GP5, Accession NM_004488.1) is another GAM30 target gene, herein designated TARGET GENE. GP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:17377, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2091] Another function of GAM30 is therefore inhibition of Glycoprotein v (platelet) (GP5, Accession NM_004488.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with GP5.

[2092] G protein-coupled receptor 81 (GPR81, Accession NM_032554.2) is another GAM30 target gene, herein designated TARGET GENE. GPR81 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR81, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:10820, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2093] Another function of GAM30 is therefore inhibition of G protein-coupled receptor 81 (GPR81, Accession NM_032554.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81.

[2094] Interferon (alpha, beta and omega) receptor 2 (IFNAR2, Accession NM_000874.2) is another GAM30 target gene, herein designated TARGET GENE. IFNAR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IFNAR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:15858, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2095] Another function of GAM30 is therefore inhibition of Interferon (alpha, beta and omega) receptor 2 (IFNAR2, Accession NM_000874.2), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2.

[2096] The function of IFNAR2 has been established by previous studies. Alpha- type antiviral protein is a factor, presumably protein in nature, that mediates specific interferon inhibition of virus replication. According to studies of mouse- man hybrid clones, the locus determining this protein is carried on chromosome 21 (Tan et al., 1973). Tan et al. (1974) made observations of dosage effect in monosomy- 21 and trisomy- 21 cells which supported assignment of the locus to chromosome 21. This character was also called interferon sensitivity (IS). Chany et al. (1975) showed that trisomy- 21 cells have increased interferon sensitivity. Trisomy- 16 cells have reduced sensitivity. This might suggest the presence on chromosome

16 of a regulator of mouse antiviral protein. Reve et al. (1976) showed that antibody to a cell surface component coded by human chromosome 21 inhibited the action of interferon. This suggested that antiviral protein is an interferon receptor. See 147570, 147640, 147660 for a discussion of the gamma, beta, and alpha interferons, respectively. De Clercq et al. (1976) concluded that it is not a cell membrane receptor for interferon that is encoded by chromosome 21 Raziuddin et al. (1984) showed that the receptors for alpha- and beta- interferons are specified by chromosome 21. It was presumed that separate genes encoded the alpha- and beta- interferon receptors. Novick et al. (1994) described a universal ligand- binding receptor for human interferons alpha and interferon beta. Sarkar and Gupta (1984) showed that gamma- interferon binds to a separate receptor that is carried by WISH cells (a human amnion cell line). The gene for the receptor was designated also IFNAR. Langer et al. (1990) sublocalized the IFNAR gene to 21q22.1- q22.2 by hybridization of (32)P- labeled recombinant interferon- alpha/beta receptor with human- hamster somatic cell hybrids containing various fragments of human chromosome 21. By in situ hybridization, Lutfalla et al. (1990) refined the assignment

to 21q22.1. Lutfalla et al. (1992) further refined the localization by pulsed field gel electrophoresis and its linkage to adjacent markers. They compared the exon structure of the IFNAR gene with that of the genes for receptors of the cytokine/growth hormone/prolactin/interferon receptor family and concluded that they have a common origin and have diverged from the immunoglobulin superfamily with which they share a common ancestor. Cellular responses to cytokines involve cross- communication through their respective receptors. The IFNs alpha, beta, and gamma mediate innate immune responses to viral infection through IFNAR1/IFNAR2 (OMIM Ref. No. 602376) for IFNA and IFNB, and IFNGR1 (OMIM Ref. No. 107470)/IFNGR2 (OMIM Ref. No. 147569) for IFNG. Stimulation of these receptors activates Janus protein kinases (e.g., JAK1, 147795 and JAK2, 147796), which leads to the tyrosine phosphorylation of STAT1 (OMIM Ref. No. 600555) and STAT2 (OMIM Ref. No. 600556). Although the IFN receptors are expressed at low levels in cells, they may be clustered in the cell membrane to permit efficient signal transduction. Using mouse embryonic fibroblasts (MEFs) from IFNAR1- and IFNGR1- deficient mice, Takaoka et al. (2000) observed that the STAT1- mediated DNA- binding

activity and the antiviral response to IFNG in IFNAR- null MEFs but not to IFNA in IFNGR- null MEFs are impaired. Restoration of the IFNG response requires constitutive subthreshold IFNA/IFNB signaling and an intact IFNAR1 capable of interacting with STAT1 after tyrosine phosphorylation. Immunoblot analysis showed that IFNAR1 coimmunoprecipitated with the nonligand- binding component, IFNGR2, of the IFNGR complex in wildtype MEFs but less well in IFNB- null MEFs. Immunoblot analysis also demonstrated that the IFN receptor components are exclusively localized in the caveolar membrane fractions (see OMIM Ref. No. CAV1; 601047) where there is a concentration of cytoplasmically oriented signaling molecules.

[2097]

[2098] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2099] Takaoka, A.; Mitani, Y.; Suemori, H.; Sato, M.; Yokochi, T.; Noguchi, S.; Tanaka, N.; Taniguchi, T. : Cross talk between interferon- gamma and - alpha/beta signaling components in caveolar membrane domains. Science 288: 2357-2360, 2000. ; and

[2100] Novick, D.; Cohen, B.; Rubinstein, M. : The human inter-

feron alpha/beta receptor: characterization and molecular cloning. Cell 77: 391- 400, 1994.

[2101] Further studies establishing the function and utilities of IFNAR2 are found in John Hopkins OMIM database record ID 602376, and in cited publications listed in Table 5, which are hereby incorporated by reference.IL22R (Accession) is another GAM30 target gene, herein designated TARGET GENE. IL22R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL22R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL22R BINDING SITE, designated SEQ ID:3063, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2102] Another function of GAM30 is therefore inhibition of IL22R (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL22R.

[2103] JM11 (Accession NM_033626.1) is another GAM30 target gene, herein designated TARGET GENE. JM11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JM11, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:19790, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2104] Another function of GAM30 is therefore inhibition of JM11 (Accession NM_033626.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11.

[2105] KIAA0924 (Accession NM_014897.1) is another GAM30 target gene, herein designated TARGET GENE. KIAA0924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:8885, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2106] Another function of GAM30 is therefore inhibition of KIAA0924 (Accession NM_014897.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0924.

[2107] KIAA0931 (Accession XM_041191.4) is another GAM30 target gene, herein designated TARGET GENE. KIAA0931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:17048, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2108] Another function of GAM30 is therefore inhibition of KIAA0931 (Accession XM_041191.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931.

[2109] KIAA1028 (Accession) is another GAM30 target gene, herein designated TARGET GENE. KIAA1028 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1028, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:7839, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2110] Another function of GAM30 is therefore inhibition of KIAA1028 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028.

[2111] KIAA1209 (Accession XM_027307.2) is another GAM30 target gene, herein designated TARGET GENE. KIAA1209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1209, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:11820, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2112] Another function of GAM30 is therefore inhibition of KIAA1209 (Accession XM_027307.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209.

[2113] KIAA1443 (Accession NM_020834.1) is another GAM30 target gene, herein designated TARGET GENE. KIAA1443 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1443 BINDING SITE, designated SEQ ID:10360, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2114] Another function of GAM30 is therefore inhibition of KIAA1443 (Accession NM_020834.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1443.

[2115] KIAA1530 (Accession XM_042661.5) is another GAM30 target gene, herein designated TARGET GENE. KIAA1530 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1530, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:10234, to the

nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2116] Another function of GAM30 is therefore inhibition of KIAA1530 (Accession XM_042661.5) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530.

[2117] KIAA1615 (Accession NM_020951.1) is another GAM30 target gene, herein designated TARGET GENE. KIAA1615 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1615, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:11333, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2118] Another function of GAM30 is therefore inhibition of KIAA1615 (Accession NM_020951.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615.

[2119] KIAA1671 (Accession XM_037809.3) is another GAM30

target gene, herein designated TARGET GENE. KIAA1671 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:6380, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2120] Another function of GAM30 is therefore inhibition of KIAA1671 (Accession XM_037809.3) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671.

[2121] KIAA1755 (Accession XM_028810.4) is another GAM30 target gene, herein designated TARGET GENE. KIAA1755 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1755, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:14311, to the nucleotide sequence of GAM30 RNA, herein designated

GAM RNA, also designated SEQ ID:346.

[2122] Another function of GAM30 is therefore inhibition of KIAA1755 (Accession XM_028810.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755.

[2123] KIAA1971 (Accession XM_058720.5) is another GAM30 target gene, herein designated TARGET GENE. KIAA1971 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:16931, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2124] Another function of GAM30 is therefore inhibition of KIAA1971 (Accession XM_058720.5) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971.

[2125] Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679.1) is another

GAM30 target gene, herein designated TARGET GENE. KMO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KMO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KMO BINDING SITE, designated SEQ ID:4388, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2126] Another function of GAM30 is therefore inhibition of Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679.1), a gene which may play a role in encephalic photoreception. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KMO.

[2127] The function of KMO has been established by previous studies. Kynurenine 3- monooxygenase (KMO; EC 1.14.13.9) is an NADPH- dependent flavin monooxygenase that catalyzes the hydroxylation of the L- tryptophan metabolite L- kynurenine to form L- 3- hydroxykynurenine. By screening a human liver cDNA library with a partial Drosophila KMO cDNA, Alberati- Giani et al. (1997)

isolated cDNAs encoding human KMO. The predicted 486-amino acid human protein shares 47% sequence identity with Drosophila KMO. When expressed in mammalian cells, recombinant human KMO exhibited kinetic properties similar to those of the native human protein. Northern blot analysis revealed that human KMO is expressed as an approximately 2- kb mRNA in liver and placenta, and at lower levels in kidney. By comparing genomic and cDNA sequences, Halford et al. (2001) determined that the KMO gene contains at least 15 exons spanning approximately 68 kb. By genomic sequence analysis, Halford et al. (2001) determined that the KMO gene overlaps with the OPN3 gene (OMIM Ref. No. 606695) on chromosome 1q43 and that the 2 genes are transcribed from opposite strands.

[2128]

[2129] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2130] Alberati- Giani, D.; Cesura, A. M.; Broger, C.; Warren, W. D.; Rover, S.; Malherbe, P. : Cloning and functional expression of human kynurenine 3- monooxygenase. FEBS Lett. 410: 407- 412, 1997. ; and

[2131] Halford, S.; Freedman, M. S.; Bellingham, J.; Inglis, S. L.;

Poopalasundaram, S.; Soni, B. G.; Foster, R. G.; Hunt, D. M. : Characterization of a novel human opsin gene with wide tissue.

[2132] Further studies establishing the function and utilities of KMO are found in John Hopkins OMIM database record ID 603538, and in cited publications listed in Table 5, which are hereby incorporated by reference.Leukocyte immunoglobulin-like receptor, subfamily a (without tm domain), member 3 (LILRA3, Accession NM_006865.1) is another GAM30 target gene, herein designated TARGET GENE. LILRA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LILRA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LILRA3 BINDING SITE, designated SEQ ID:6616, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2133] Another function of GAM30 is therefore inhibition of Leukocyte immunoglobulin-like receptor, subfamily a (without tm domain), member 3 (LILRA3, Accession NM_006865.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with LILRA3.

[2134] LOC112687 (Accession XM_053145.2) is another GAM30 target gene, herein designated TARGET GENE. LOC112687 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC112687, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC112687 BINDING SITE, designated SEQ ID:17001, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2135] Another function of GAM30 is therefore inhibition of LOC112687 (Accession XM_053145.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112687.

[2136] LOC112724 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC112724 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC112724, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC112724 BINDING SITE, designated SEQ ID:18154, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2137] Another function of GAM30 is therefore inhibition of LOC112724 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112724.

[2138] LOC120114 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC120114 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC120114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, designated SEQ ID:3066, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2139] Another function of GAM30 is therefore inhibition of LOC120114 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114.

[2140] LOC126669 (Accession XM_060121.4) is another GAM30 target gene, herein designated TARGET GENE. LOC126669

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:2535, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2141] Another function of GAM30 is therefore inhibition of LOC126669 (Accession XM_060121.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669.

[2142] LOC130813 (Accession XM_065904.2) is another GAM30 target gene, herein designated TARGET GENE. LOC130813 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:9431, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2143] Another function of GAM30 is therefore inhibition of LOC130813 (Accession XM_065904.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813.

[2144] LOC131308 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC131308 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131308, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131308 BINDING SITE, designated SEQ ID:19649, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2145] Another function of GAM30 is therefore inhibition of LOC131308 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131308.

[2146] LOC144317 (Accession XM_084813.4) is another GAM30 target gene, herein designated TARGET GENE. LOC144317 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144317, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144317 BINDING SITE, designated SEQ ID:10860, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2147] Another function of GAM30 is therefore inhibition of LOC144317 (Accession XM_084813.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144317.

[2148] LOC144776 (Accession XM_084964.1) is another GAM30 target gene, herein designated TARGET GENE. LOC144776 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144776, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144776 BINDING SITE, designated SEQ ID:12238, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2149] Another function of GAM30 is therefore inhibition of LOC144776 (Accession XM_084964.1) . Accordingly, utili-

ties of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144776.

[2150] LOC145725 (Accession XM_085211.7) is another GAM30 target gene, herein designated TARGET GENE. LOC145725 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145725, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:18697, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2151] Another function of GAM30 is therefore inhibition of LOC145725 (Accession XM_085211.7) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725.

[2152] LOC146894 (Accession NM_145273.1) is another GAM30 target gene, herein designated TARGET GENE. LOC146894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146894, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:2861, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2153] Another function of GAM30 is therefore inhibition of LOC146894 (Accession NM_145273.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894.

[2154] LOC147660 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC147660 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147660, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147660 BINDING SITE, designated SEQ ID:10444, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2155] Another function of GAM30 is therefore inhibition of LOC147660 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC147660.

[2156] LOC147817 (Accession XM_085903.2) is another GAM30 target gene, herein designated TARGET GENE. LOC147817 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:1405, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2157] Another function of GAM30 is therefore inhibition of LOC147817 (Accession XM_085903.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817.

[2158] LOC147841 (Accession XM_085924.6) is another GAM30 target gene, herein designated TARGET GENE. LOC147841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC147841 BINDING SITE, designated SEQ ID:9060, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2159] Another function of GAM30 is therefore inhibition of LOC147841 (Accession XM_085924.6) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147841.

[2160] LOC148137 (Accession NM_144692.1) is another GAM30 target gene, herein designated TARGET GENE. LOC148137 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:4235, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2161] Another function of GAM30 is therefore inhibition of LOC148137 (Accession NM_144692.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137.

[2162] LOC149506 (Accession XM_097661.4) is another GAM30 target gene, herein designated TARGET GENE. LOC149506 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:13189, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2163] Another function of GAM30 is therefore inhibition of LOC149506 (Accession XM_097661.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506.

[2164] LOC149577 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC149577 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149577, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:14550, to

the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2165] Another function of GAM30 is therefore inhibition of LOC149577 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149577.

[2166] LOC150225 (Accession XM_097870.1) is another GAM30 target gene, herein designated TARGET GENE. LOC150225 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150225, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:4075, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2167] Another function of GAM30 is therefore inhibition of LOC150225 (Accession XM_097870.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225.

[2168] LOC150397 (Accession XM_086907.1) is another GAM30 target gene, herein designated TARGET GENE. LOC150397

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:2564, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2169] Another function of GAM30 is therefore inhibition of LOC150397 (Accession XM_086907.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397.

[2170] LOC150407 (Accession XM_086906.1) is another GAM30 target gene, herein designated TARGET GENE. LOC150407 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150407, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:7870, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2171] Another function of GAM30 is therefore inhibition of LOC150407 (Accession XM_086906.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407.

[2172] LOC151195 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC151195 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151195, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151195 BINDING SITE, designated SEQ ID:11539, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2173] Another function of GAM30 is therefore inhibition of LOC151195 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151195.

[2174] LOC151201 (Accession XM_098021.1) is another GAM30 target gene, herein designated TARGET GENE. LOC151201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151201, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:8212, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2175] Another function of GAM30 is therefore inhibition of LOC151201 (Accession XM_098021.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201.

[2176] LOC151475 (Accession XM_098063.1) is another GAM30 target gene, herein designated TARGET GENE. LOC151475 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151475, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:9643, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2177] Another function of GAM30 is therefore inhibition of LOC151475 (Accession XM_098063.1) . Accordingly, utili-

ties of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475.

[2178] LOC152220 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC152220 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:13105, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2179] Another function of GAM30 is therefore inhibition of LOC152220 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220.

[2180] LOC152245 (Accession XM_098182.1) is another GAM30 target gene, herein designated TARGET GENE. LOC152245 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152245, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC152245 BINDING SITE, designated SEQ ID:8742, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2181] Another function of GAM30 is therefore inhibition of LOC152245 (Accession XM_098182.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152245.

[2182] LOC152851 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC152851 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152851, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152851 BINDING SITE, designated SEQ ID:3475, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2183] Another function of GAM30 is therefore inhibition of LOC152851 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152851.

[2184] LOC153910 (Accession XM_087801.1) is another GAM30 target gene, herein designated TARGET GENE. LOC153910 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153910, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153910 BINDING SITE, designated SEQ ID:18292, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2185] Another function of GAM30 is therefore inhibition of LOC153910 (Accession XM_087801.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153910.

[2186] LOC154877 (Accession XM_098626.4) is another GAM30 target gene, herein designated TARGET GENE. LOC154877 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:19686, to

the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2187] Another function of GAM30 is therefore inhibition of LOC154877 (Accession XM_098626.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877.

[2188] LOC196264 (Accession XM_113683.2) is another GAM30 target gene, herein designated TARGET GENE. LOC196264 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196264, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:1093, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2189] Another function of GAM30 is therefore inhibition of LOC196264 (Accession XM_113683.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264.

[2190] LOC199899 (Accession XM_117153.2) is another GAM30

target gene, herein designated TARGET GENE. LOC199899 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC199899, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199899 BINDING SITE, designated SEQ ID:3354, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2191] Another function of GAM30 is therefore inhibition of LOC199899 (Accession XM_117153.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199899.

[2192] LOC199906 (Accession XM_114052.1) is another GAM30 target gene, herein designated TARGET GENE. LOC199906 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199906 BINDING SITE, designated SEQ ID:4862, to the nucleotide sequence of GAM30 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:346.

[2193] Another function of GAM30 is therefore inhibition of LOC199906 (Accession XM_114052.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199906.

[2194] LOC200316 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC200316 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200316 BINDING SITE, designated SEQ ID:737, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2195] Another function of GAM30 is therefore inhibition of LOC200316 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200316.

[2196] LOC201294 (Accession XM_113950.4) is another GAM30 target gene, herein designated TARGET GENE. LOC201294 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC201294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201294 BINDING SITE, designated SEQ ID:10229, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2197] Another function of GAM30 is therefore inhibition of LOC201294 (Accession XM_113950.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201294.

[2198] LOC203297 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC203297 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC203297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203297 BINDING SITE, designated SEQ ID:10855, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2199] Another function of GAM30 is therefore inhibition of

LOC203297 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203297.

[2200] LOC219731 (Accession XM_167596.2) is another GAM30 target gene, herein designated TARGET GENE. LOC219731 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:6006, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2201] Another function of GAM30 is therefore inhibition of LOC219731 (Accession XM_167596.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219731.

[2202] LOC220074 (Accession NM_145309.1) is another GAM30 target gene, herein designated TARGET GENE. LOC220074 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220074, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220074 BINDING SITE, designated SEQ ID:18789, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2203] Another function of GAM30 is therefore inhibition of LOC220074 (Accession NM_145309.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220074.

[2204] LOC220846 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC220846 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220846, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220846 BINDING SITE, designated SEQ ID:17037, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2205] Another function of GAM30 is therefore inhibition of LOC220846 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC220846.

[2206] LOC221035 (Accession XM_167640.4) is another GAM30 target gene, herein designated TARGET GENE. LOC221035 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221035 BINDING SITE, designated SEQ ID:10230, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2207] Another function of GAM30 is therefore inhibition of LOC221035 (Accession XM_167640.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221035.

[2208] LOC221122 (Accession XM_167867.3) is another GAM30 target gene, herein designated TARGET GENE. LOC221122 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC221122 BINDING SITE, designated SEQ ID:8153, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2209] Another function of GAM30 is therefore inhibition of LOC221122 (Accession XM_167867.3) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221122.

[2210] LOC221271 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC221271 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221271, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:11173, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2211] Another function of GAM30 is therefore inhibition of LOC221271 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271.

[2212] LOC221814 (Accession XM_168226.1) is another GAM30

target gene, herein designated TARGET GENE. LOC221814 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221814, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:7134, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2213] Another function of GAM30 is therefore inhibition of LOC221814 (Accession XM_168226.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814.

[2214] LOC221960 (Accession XM_165859.1) is another GAM30 target gene, herein designated TARGET GENE. LOC221960 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221960, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221960 BINDING SITE, designated SEQ ID:5655, to the nucleotide sequence of GAM30 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:346.

[2215] Another function of GAM30 is therefore inhibition of LOC221960 (Accession XM_165859.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221960.

[2216] LOC222070 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC222070 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC222070, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:3096, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2217] Another function of GAM30 is therefore inhibition of LOC222070 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070.

[2218] LOC254082 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC254082 BINDING SITE is a target binding site found in the 5` untranslated

region of mRNA encoded by LOC254082, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254082 BINDING SITE, designated SEQ ID:6592, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2219] Another function of GAM30 is therefore inhibition of LOC254082 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254082.

[2220] LOC254381 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC254381 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254381, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254381 BINDING SITE, designated SEQ ID:5429, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2221] Another function of GAM30 is therefore inhibition of LOC254381 (Accession) . Accordingly, utilities of GAM30

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254381.

[2222] LOC255196 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC255196 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255196, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:6253, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2223] Another function of GAM30 is therefore inhibition of LOC255196 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196.

[2224] LOC256221 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC256221 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256221, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC256221 BINDING SITE, designated SEQ ID:19801, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2225] Another function of GAM30 is therefore inhibition of LOC256221 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256221.

[2226] LOC257465 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC257465 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257465, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257465 BINDING SITE, designated SEQ ID:8329, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2227] Another function of GAM30 is therefore inhibition of LOC257465 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257465.

[2228] LOC51031 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC51031 BINDING SITE

is a target binding site found in the 5` untranslated region of mRNA encoded by LOC51031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51031 BINDING SITE, designated SEQ ID:20151, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2229] Another function of GAM30 is therefore inhibition of LOC51031 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51031.

[2230] LOC51336 (Accession NM_016646.1) is another GAM30 target gene, herein designated TARGET GENE. LOC51336 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51336, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:4139, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2231] Another function of GAM30 is therefore inhibition of

LOC51336 (Accession NM_016646.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336.

[2232] LOC90155 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC90155 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90155, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90155 BINDING SITE, designated SEQ ID:12504, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2233] Another function of GAM30 is therefore inhibition of LOC90155 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90155.

[2234] LOC91661 (Accession NM_138372.1) is another GAM30 target gene, herein designated TARGET GENE. LOC91661 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91661, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:3371, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2235] Another function of GAM30 is therefore inhibition of LOC91661 (Accession NM_138372.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661.

[2236] LOC92148 (Accession XM_043160.9) is another GAM30 target gene, herein designated TARGET GENE. LOC92148 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92148, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92148 BINDING SITE, designated SEQ ID:14208, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2237] Another function of GAM30 is therefore inhibition of LOC92148 (Accession XM_043160.9) . Accordingly, utilities of GAM30 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92148.

[2238] LOC92303 (Accession) is another GAM30 target gene, herein designated TARGET GENE. LOC92303 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92303, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92303 BINDING SITE, designated SEQ ID:16126, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2239] Another function of GAM30 is therefore inhibition of LOC92303 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92303.

[2240] LOC93408 (Accession NM_138403.1) is another GAM30 target gene, herein designated TARGET GENE. LOC93408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC93408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC93408 BINDING SITE, designated SEQ ID:3385, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2241] Another function of GAM30 is therefore inhibition of LOC93408 (Accession NM_138403.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93408.

[2242] Leukotriene b4 receptor (LTB4R, Accession NM_000752.1) is another GAM30 target gene, herein designated TARGET GENE. LTB4R BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LTB4R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTB4R BINDING SITE, designated SEQ ID:14766, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2243] Another function of GAM30 is therefore inhibition of Leukotriene b4 receptor (LTB4R, Accession NM_000752.1), a gene which may be the cardiac p2y receptor involved in the regulation of cardiac muscle contraction through modulation of l- type calcium currents.

Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTB4R.

[2244] The function of LTB4R has been established by previous studies. Yokomizo et al. (1997) found that the putative purinoceptor P2Y7 has a primary structure identical to that of a BLTR clone, HL- 5. To determine whether BLTR also functions as a purinoceptor, they established stable transformants of BLTR in glioma cells that possess negligible amounts of intrinsic purinoceptors. In these cells, up to 300 microM caused no change in intracellular calcium levels, but significant increases in the calcium concentrations were induced by exposure to 10 nanoM LTB4. These results were interpreted to indicate that this receptor is not a purinoceptor, but a BLTR By genomic sequence analysis, Kato et al. (2000) determined that BLT1 lacks TATA and CAAT elements but possesses a GC- rich sequence in the promoter region. Luciferase reporter analysis showed that the region required for basal transcription, which is activated by SP1, is about 80 bp upstream from the initiator sequence. Southern blot analysis revealed that the CpG sites of the BLT1 promoter are highly methylated in cells not expressing BLT1, but are un-

methylated in cells expressing BLT1. Kato et al. (2000) also found that the promoter region of BLT1 is localized within the open reading frame encoding BLT2 (OMIM Ref. No. 605773).

[2245]

[2246] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2247] Yokomizo, T.; Izumi, T.; Chang, K.; Takuwa, Y.; Shimizu, T. : A G- protein- coupled receptor for leukotriene B4 that mediates chemotaxis. Nature 387: 620- 624, 1997. ; and

[2248] Kato, K.; Yokomizo, T.; Izumi, T.; Shimizu, T. : Cell- specific transcriptional regulation of human leukotriene B4 receptor gene. J. Exp. Med. 192: 413- 420, 2000.

[2249] Further studies establishing the function and utilities of LTB4R are found in John Hopkins OMIM database record ID 601531, and in cited publications listed in Table 5, which are hereby incorporated by reference.Lymphocyte antigen 75 (LY75, Accession NM_002349.1) is another GAM30 target gene, herein designated TARGET GENE. LY75 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LY75, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LY75 BINDING SITE, designated SEQ ID:5206, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2250] Another function of GAM30 is therefore inhibition of Lymphocyte antigen 75 (LY75, Accession NM_002349.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY75.

[2251] Male germ cell-associated kinase (MAK, Accession NM_005906.2) is another GAM30 target gene, herein designated TARGET GENE. MAK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAK BINDING SITE, designated SEQ ID:12945, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2252] Another function of GAM30 is therefore inhibition of Male germ cell-associated kinase (MAK, Accession NM_005906.2), a gene which plays an important role in

spermatogenesis. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAK.

[2253] The function of MAK has been established by previous studies. Male germ cell- associated kinase is one of the protein kinases that was isolated by weak cross- hybridization with the v- ros (OMIM Ref. No. 165020) protein kinase sequence (Matsushime et al., 1990). The gene encoding this kinase is expressed almost exclusively in testis, mainly in germ cells at and/or after the pachytene stage, as 66- and 60- kD proteins that form a distinct complex with cellular phosphoprotein p210. The p210 protein is sufficiently phosphorylated in vitro by the MAK gene product at serine and threonine residues. These results suggest that the MAK gene plays an important role in spermatogenesis. Using a panel of DNA samples from an interspecific cross, Taketo et al. (1994) mapped the Mak gene to mouse chromosome 13 in an area situated between 2 regions that are homologous with human chromosome 6p and chromosome 5. Taketo et al. (1994) stated that preliminary Southern analysis of DNA samples from a panel of mouse/human somatic cell hybrids showed concordant hybridization of the MAK gene and

the ROS1 gene, previously mapped to 6q22

[2258] Further studies establishing the function and utilities of MAK are found in John Hopkins OMIM database record ID 154235, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC10818 (Accession NM_030568.2) is another GAM30 target gene, herein designated TARGET GENE. MGC10818 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10818, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of MGC10818 BINDING SITE, designated SEQ ID:6357, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2259] Another function of GAM30 is therefore inhibition of MGC10818 (Accession NM_030568.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818.

[2260] MGC5149 (Accession XM_051200.4) is another GAM30 target gene, herein designated TARGET GENE. MGC5149 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC5149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:1092, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2261] Another function of GAM30 is therefore inhibition of MGC5149 (Accession XM_051200.4) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5149.

[2262] MGC9912 (Accession NM_080664.1) is another GAM30 target gene, herein designated TARGET GENE. MGC9912 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC9912, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC9912 BINDING SITE, designated SEQ ID:12264, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2263] Another function of GAM30 is therefore inhibition of MGC9912 (Accession NM_080664.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9912.

[2264] Matrix metalloproteinase-like 1 (MMPL1, Accession) is another GAM30 target gene, herein designated TARGET GENE. MMPL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MMPL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MMPL1 BINDING SITE, designated

SEQ ID:4015, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2265] Another function of GAM30 is therefore inhibition of Matrix metalloproteinase-like 1 (MMPL1, Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMPL1.

[2266] Myeloproliferative leukemia virus oncogene (MPL, Accession NM_005373.1) is another GAM30 target gene, herein designated TARGET GENE. MPL BINDING SITE1 and MPL BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MPL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MPL BINDING SITE1 and MPL BINDING SITE2, designated SEQ ID:6226 and SEQ ID:17342 respectively, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2267] Another function of GAM30 is therefore inhibition of Myeloproliferative leukemia virus oncogene (MPL, Accession NM_005373.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MPL.

[2268] Nuclear receptor coactivator 6 interacting protein (NCOA6IP, Accession NM_024831.5) is another GAM30 target gene, herein designated TARGET GENE. NCOA6IP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCOA6IP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCOA6IP BINDING SITE, designated SEQ ID:10449, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2269] Another function of GAM30 is therefore inhibition of Nuclear receptor coactivator 6 interacting protein (NCOA6IP, Accession NM_024831.5) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6IP.

[2270] NOSIP (Accession NM_015953.2) is another GAM30 target gene, herein designated TARGET GENE. NOSIP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NOSIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of NOSIP BINDING SITE, designated SEQ ID:12237, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2271] Another function of GAM30 is therefore inhibition of NOSIP (Accession NM_015953.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOSIP.

[2272] 5'-nucleotidase, cytosolic ii (NT5C2, Accession NM_012229.2) is another GAM30 target gene, herein designated TARGET GENE. NT5C2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NT5C2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NT5C2 BINDING SITE, designated SEQ ID:13752, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2273] Another function of GAM30 is therefore inhibition of 5'-nucleotidase, cytosolic ii (NT5C2, Accession NM_012229.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C2.

[2274] Protocadherin alpha 9 (PCDHA9, Accession NM_031857.1) is another GAM30 target gene, herein designated TARGET GENE. PCDHA9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDHA9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:1499, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2275] Another function of GAM30 is therefore inhibition of Protocadherin alpha 9 (PCDHA9, Accession NM_031857.1), a gene which is a calcium- dependent cell- adhesion protein. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9.

[2276] The function of PCDHA9 has been established by previous studies. Cadherins are calcium- dependent cell- cell adhesion molecules that mediate neural cell- cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHA9 is a member of the alpha cluster of protocadherin genes on 5q31. By screening a brain cDNA

library for sequences with the potential to encode large proteins, Nagase et al. (1997) identified a cDNA encoding PCDHA9, which they termed KIAA0345. The deduced protein has 842 amino acids. RT- PCR analysis detected strongest expression of KIAA0345 in kidney and testis, followed by brain, lung, pancreas, and ovary.

[2277]

[2278] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2279] Nagase, T.; Ishikawa, I.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; O'Hara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141- 150, 1997. ; and

[2281] Further studies establishing the function and utilities of PCDHA9 are found in John Hopkins OMIM database record ID 606315, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Protocadherin beta 11 (PCDHB11, Accession NM_018931.2) is another GAM30 target gene, herein designated TARGET GENE. PCDHB11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHB11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHB11 BINDING SITE, designated SEQ ID:1970, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2282] Another function of GAM30 is therefore inhibition of Protocadherin beta 11 (PCDHB11, Accession NM_018931.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB11.

[2283] Phosducin-like (PDCL, Accession NM_005388.2) is another GAM30 target gene, herein designated TARGET GENE. PDCL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDCL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of PDCL BINDING SITE, designated SEQ ID:13181, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2284] Another function of GAM30 is therefore inhibition of Phosducin-like (PDCL, Accession NM_005388.2), a gene which may regulate G- protein signaling and similar to phosducins. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCL.

[2285] The function of PDCL has been established by previous studies. Phosducin- like protein (PDCL) is a putative modulator of heterotrimeric G proteins. It was initially isolated as the product of an ethanol- responsive gene in neural cell cultures (Miles et al., 1993). PDCL shares extensive amino acid sequence homology with phosducin (PDC; 171490), a phosphoprotein expressed in retina and pineal gland that inhibits several G protein- coupled signaling pathways by binding to the beta- gamma subunits of G proteins. By screening a human genomic library with a rat Pdcl cDNA, Thibault et al. (1999) isolated a partial PDCL genomic sequence. They also identified several PDCL ESTs. The authors derived the complete PDCL coding sequence by aligning the genomic and EST sequences. The

predicted 301- amino acid PDCL protein shows homology to areas of rat Pdc that contact G protein beta- gamma subunits. The N- terminal regions of human, rat, and Drosophila PDCL are highly homologous to each other, but show little homology to the N- terminal region of rat Pdc. By somatic cell hybrid analysis, Thibault et al. (1999) mapped the PDCL gene to chromosome 9. Using a radiation hybrid mapping panel, they found that the PDCL gene is linked to markers D9S1876 and D9S1674.

[2286]

[2287] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2288] Miles, M. F.; Barhite, S.; Sganga, M.; Elliott, M. : Phosducin- like protein: an ethanol- responsive potential modulator of guanine nucleotide- binding protein function. Proc. Nat. Acad. Sci. 90: 10831- 10835, 1993. ; and

[2289] Thibault, C.; Wang, J. F.; Charnas, R.; Mirel, D.; Barhite, S.; Miles, M. F. : Cloning and characterization of the rat and human phosducin- like protein genes: structure, expression and.

[2290] Further studies establishing the function and utilities of PDCL are found in John Hopkins OMIM database record ID

604421, and in cited publications listed in Table 5, which are hereby incorporated by reference.Polymerase (dna directed), epsilon 3 (p17 subunit) (POLE3, Accession NM_017443.2) is another GAM30 target gene, herein designated TARGET GENE. POLE3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POLE3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLE3 BINDING SITE, designated SEQ ID:11472, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2291] Another function of GAM30 is therefore inhibition of Polymerase (dna directed), epsilon 3 (p17 subunit) (POLE3, Accession NM_017443.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLE3.

[2292] Pou domain, class 2, associating factor 1 (POU2AF1, Accession NM_006235.1) is another GAM30 target gene, herein designated TARGET GENE. POU2AF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POU2AF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:1335, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2293] Another function of GAM30 is therefore inhibition of Pou domain, class 2, associating factor 1 (POU2AF1, Accession NM_006235.1), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2 and therefore may be associated with A form of b- cell leukemia. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of A form of b- cell leukemia, and of other diseases and clinical conditions associated with POU2AF1.

[2294] The function of POU2AF1 has been established by previous studies. POU domain proteins contain a bipartite DNA- binding domain divided by a flexible linker that enables them to adopt various monomer configurations on DNA. The versatility of POU protein operation is additionally conferred at the dimerization level. Tomilin et al. (2000) found that the POU dimer from the OCT1 gene formed on the palindromic OCT factor recognition element, or PORE (ATTTGAAATGCAAAT), could recruit the

transcriptional coactivator OBF1, whereas POU dimers formed on the consensus MORE (more PORE) (ATGCATATGCAT) or on MOREs from Ig heavy chain promoters (AT[G/A][C/A]ATATGCAA) failed to interact. An interaction with OBF1 was precluded since the same OCT1 residues that form the MORE dimerization interface are also used for OBF1/OCT1 interactions on the PORE. These findings provided a paradigm of how specific POU dimer assemblies can differentially recruit a coregulatory activity with distinct transcriptional readouts.

[2295] Animal model experiments lend further support to the function of POU2AF1. Schubart et al. (2001) noted that Oct2- deficient mice die at birth but have normal B- cell development and transcription of Ig genes. Obf1- deficient mice are viable with unaffected B- cell development in bone marrow and normal serum IgM but have reduced B- cell numbers in spleen and low serum IgG. By creating double knockout mice, Schubart et al. (2001) confirmed that B- cell development and Ig gene transcription can proceed normally without these B- cell specific factors. However, in these animals the mature B- cell pool was strongly reduced, suggesting that these factors play an important role in controlling the expansion and/or main-

tenance of mature B cells.

[2296] It is appreciated that the abovementioned animal model for POU2AF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2297] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2298] Schubart, K.; Massa, S.; Schubart, D.; Corcoran, L. M.; Rolink, A. G.; Matthias, P. : B cell development and immunoglobulin gene transcription in the absence of Oct- 2 and OBF- 1. Nature Immun. 2: 69- 74, 2001. ; and

[2299] Tomilin, A.; Remenyi, A.; Lins, K.; Bak, H.; Leidel, S.; Vriend, G.; Wilmanns, M.; Scholer, H. R. : Synergism with the coactivator OBF- 1 (OCA- B, BOB- 1) is mediated by a specific POU dimer.

[2300] Further studies establishing the function and utilities of POU2AF1 are found in John Hopkins OMIM database record ID 601206, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRO0365 (Accession NM_014126.1) is another GAM30 target gene, herein designated TARGET GENE. PRO0365 BINDING SITE is a target binding site found in the 5` untranslated re-

gion of mRNA encoded by PRO0365, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:7384, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2301] Another function of GAM30 is therefore inhibition of PRO0365 (Accession NM_014126.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365.

[2302] Periaxin (PRX, Accession NM_020956.1) is another GAM30 target gene, herein designated TARGET GENE. PRX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:6453, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2303] Another function of GAM30 is therefore inhibition of Periaxin (PRX, Accession NM_020956.1), a gene which seems

to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon- glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin- associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition and therefore is associated with Dejerine- sottas neuropathy, autosomal recessive. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Dejerine- sottas neuropathy, autosomal recessive, and of other diseases and clinical conditions associated with PRX.

[2304] The function of PRX has been established by previous studies. The periaxin gene (PRX) encodes 2 PDZ- domain proteins, L- and S- periaxin, that are required for maintenance of peripheral nerve myelin. The PDZ domain, which consists of a nearly 90- amino acid protein- binding motif that interacts with the C termini of plasma membrane proteins and with the cortical cytoskeleton, has been implicated in the assembly of signaling complexes at sites of cell- cell contact. By FISH and electronic PCR (Schuler, 1997), Boerkoel et al. (2001) mapped the PRX gene between D19S324 and D19S223 within a BAC on 19q13.1-q13.2, a position showing conserved synteny with mouse

chromosome 7 where the Prx gene maps (Gillespie et al., 1997). They pointed out that the interactions among L-periaxin, the cytoskeleton, and a membrane complex are reminiscent of the interactions among the proteins of the dystrophin- sarcoglycan complex (Cohn and Campbell, 2000) and the signaling complexes organized by other PDZ domain proteins. They hypothesized that mutations in cytoskeletal and membrane proteins interacting with L-periaxin may also cause Charcot- Marie- Tooth disease or related neuropathies. In 3 unrelated patients with Dejer-ine- Sottas neuropathy (OMIM Ref. No. 145900), Boerkoel et al. (2001) identified recessive mutations in the PRX gene (605725.0001- 605725.004). They mapped reces-sive Dejerine- Sottas neuropathy to 19q13.1- q13.2, a re-gion associated with a severe autosomal recessive de-myelinating neuropathy in a Lebanese family reported by Delague et al. (2000) as Charcot- Marie- Tooth disease type 4F.

[2305] Animal model experiments lend further support to the function of PRX. Confirming the necessity of periaxin for maintenance of the myelin sheath, Gillespie et al. (2000) demonstrated that Prx - /- mice ensheath and myelinate peripheral axons apparently normally but subsequently

develop a severe demyelinating neuropathy associated with allodynia (pain from non- noxious stimuli) and hyperalgesia (hypersensitivity to pain).

[2306] It is appreciated that the abovementioned animal model for PRX is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2308] Takashima, H.; Boerkoel, C. F.; De Jonghe, P.; Ceuterick, C.; Martin, J.- J.; Voit, T.; Schroder, J.- M.; Williams, A.; Brophy, P. J.; Timmerman, V.; Lupski, J. R. : Periaxin mutations cause a broad spectrum of demyelinating neuropathies. Ann. Neurol. 51: 709- 715, 2002. ; and

[2309] Boerkoel, C. F.; Takashima, H.; Stankiewicz, P.; Garcia, C. A.; Leber, S. M.; Rhee- Morris, L.; Lupski, J. R. : Periaxin mutations cause recessive Dejerine- Sottas neuropathy. Am. J. Hum.

[2310] Further studies establishing the function and utilities of PRX are found in John Hopkins OMIM database record ID 605725, and in cited publications listed in Table 5, which are hereby incorporated by reference.Proteasome

(prosome, macropain) 26s subunit, non-atpase, 9 (PSMD9, Accession NM_002813.3) is another GAM30 target gene, herein designated TARGET GENE. PSMD9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSMD9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSMD9 BINDING SITE, designated SEQ ID:8316, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2311] Another function of GAM30 is therefore inhibition of Proteasome (prosome, macropain) 26s subunit, non-atpase, 9 (PSMD9, Accession NM_002813.3), a gene which acts as a regulatory subunit of the 26 proteasome. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD9.

[2312] The function of PSMD9 has been established by previous studies. The 26S proteasome is a eukaryotic ATP- dependent protease that selectively degrades intracellular target proteins that are modified by the covalent attachment of ubiquitin. It is composed of a central catalytic 20S protea-

some, which consists of a family of small proteins, and 2 large regulatory modules, named PA700, which consist of approximately 20 heterogeneous proteins. A proteasomal modulator complex, composed of p27, p42, and p50 subunits, stimulates the association of the 20S proteasome with PA700 to form the active 26S proteasome. Watanabe et al. (1998) cloned 2 distinct human brain cDNAs encoding p27, or PSMD9. Compared with the longer cDNA, the shorter cDNA has a 65- bp deletion near the 3- prime region that results in a new inframe termination codon farther downstream. The longer cDNA encodes a deduced 209- amino acid protein with a calculated molecular mass of 22,764 Da. The shorter cDNA encodes a deduced 223- amino acid protein with a calculated molecular mass of 24,652 Da. The longer PSMD9 protein exhibits 36% sequence identity with an S. cerevisiae protein, which the authors named NAS2 for 'non- ATPase subunit 2,' and 31.9% identity with a C. elegans protein. Disruption of the yeast NAS2 gene did not affect cell viability or proliferation. Watanabe et al. (1998) demonstrated that the PSMD9 protein, along with the ATPase components TBP1 (PSMC3; 186852) and p42 (PSMC6; 602708), associated with both the modulator complex and the 26S proteasome complex.

Northern blot analysis detected an approximately 1.3- kb PSMD9 transcript in all tissues examined, with highest levels in liver and kidney. E12 and E47 (see OMIM Ref. No. TCF3; 147141), members of the ubiquitous E2A protein family, function with basic helix- loop- helix (bHLH) proteins to bind and transactivate promoters via conserved sequence elements known as E boxes. By yeast 2- hybrid screening of a rat insulinoma cell cDNA library using the bHLH domain- containing C terminus of E12 as bait, Thomas et al. (1999) obtained a cDNA encoding rat Bridge- 1. Sequence analysis predicted that the 222- amino acid Bridge- 1 protein shares 98% amino acid similarity with human PSMD9 over the first 184 amino acids but diverges in the C terminus Bridge- 1 contains a PDZ- like domain from amino acids 138 to 178, forming 3 beta sheets and 2 alpha helices. SDS- PAGE analysis showed that Bridge- 1 is expressed as a 28- kD protein, close to the deduced value of 25 kD. Using Bridge- 1 cDNA as probe, Northern blot analysis detected a 1.0- kb transcript in all rat and human tissues tested, with highest expression in pancreas, testis, kidney, and liver. Immunocytochemistry assessment demonstrated predominant nuclear localization of Bridge- 1, with lower levels in cyto-

plasm. Immunoprecipitation analysis determined that anti- Bridge- 1 coimmunoprecipitates E12 or E12 and E47 through their C- terminal bHLH domains, but only in the presence of the PDZ domain of Bridge- 1. CAT assays indicated that Bridge- 1 together with E12 or E47 coactivates insulin (OMIM Ref. No. 176730) promoter elements.

[2313]

[2314] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2315] Thomas, M. K.; Yao, K.- M.; Tenser, M. S.; Wong, G. G.; Habener, J. F. : Bridge- 1, a novel PDZ- domain coactivator of E2A- mediated regulation of insulin gene transcription. Molec. Cell. Biol. 19: 8492- 8504, 1999. ; and

[2316] Watanabe, T. K.; Saito, A.; Suzuki, M.; Fujiwara, T.; Takahashi, E.; Slaughter, C. A.; DeMartino, G. N.; Hendil, K. B.; Chung, C. H.; Tanahashi, N.; Tanaka, K. : cDNA cloning and chara.

[2317] Further studies establishing the function and utilities of PSMD9 are found in John Hopkins OMIM database record ID 603146, and in cited publications listed in Table 5, which are hereby incorporated by reference.Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession

NM_000961.2) is another GAM30 target gene, herein designated TARGET GENE. PTGIS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGIS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:701, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2318] Another function of GAM30 is therefore inhibition of Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession NM_000961.2), a gene which catalyzes the isomerization of prostaglandin h2 to prostacyclin (= prostaglandin i2). Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGIS.

[2319] The function of PTGIS has been established by previous studies. Yokoyama et al. (1996) demonstrated that the prostacyclin synthase gene, which they symbolized PTGIS, consists of 10 exons spanning approximately 60 kb. All the splice donor and acceptor sites conformed to the GT/AG rule. The major product of the primer extension analysis suggested that the transcription of the gene started

from the positions around 49 bp upstream of the translation initiation codon. By fluorescence in situ hybridization, they demonstrated that the gene is located at 20q13.11-q13.13. Prostacyclin (also known as prostaglandin I2) is a potent vasodilator and inhibitor of platelet aggregation. The enzyme prostacyclin synthase (EC 5.3.99.4) catalyzes the isomerization of prostaglandin H2 (PGH2) to prostacyclin. Wang and Chen (1996) noted that although it has absorbance spectral features characteristic of the cytochrome P450s, PGIS has no monooxygenase activity and does not require an external source of electrons to initiate its enzyme reaction. Prostacyclin synthase is the single member of family 8 of the cytochrome P450 superfamily (Nelson et al., 1996).

[2320]

[2321] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2322] Wang, L.- H.; Chen, L. : Organization of the gene encoding human prostacyclin synthase. Biochem. Biophys. Res. Commun. 226: 631- 637, 1996. ; and

[2323] Yokoyama, C.; Yabuki, T.; Inoue, H.; Tone, Y.; Hara, S.; Hatae, T.; Nagata, M.; Takahashi, E.- I.; Tanabe, T. : Hu-

man gene encoding prostacyclin synthase (PTGIS): genomic organization, ch.

[2324] Further studies establishing the function and utilities of PTGIS are found in John Hopkins OMIM database record ID 601699, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rab14, member ras oncogene family (RAB14, Accession NM_016322.2) is another GAM30 target gene, herein designated TARGET GENE. RAB14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB14 BINDING SITE, designated SEQ ID:14594, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2325] Another function of GAM30 is therefore inhibition of Rab14, member ras oncogene family (RAB14, Accession NM_016322.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB14.

[2326] Rab33b, member ras oncogene family (RAB33B, Accession NM_031296.1) is another GAM30 target gene, herein des-

ignated TARGET GENE. RAB33B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB33B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:8204, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2327] Another function of GAM30 is therefore inhibition of Rab33b, member ras oncogene family (RAB33B, Accession NM_031296.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B.

[2328] RAP140 (Accession NM_015224.1) is another GAM30 target gene, herein designated TARGET GENE. RAP140 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:7259, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA,

also designated SEQ ID:346.

[2329] Another function of GAM30 is therefore inhibition of RAP140 (Accession NM_015224.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140.

[2330] Ring finger protein (c3hc4 type) 8 (RNF8, Accession NM_003958.1) is another GAM30 target gene, herein designated TARGET GENE. RNF8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:9153, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2331] Another function of GAM30 is therefore inhibition of Ring finger protein (c3hc4 type) 8 (RNF8, Accession NM_003958.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8.

[2332] SCYA20 (Accession) is another GAM30 target gene, herein designated TARGET GENE. SCYA20 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by SCYA20, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCYA20 BINDING SITE, designated SEQ ID:4575, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2333] Another function of GAM30 is therefore inhibition of SCYA20 (Accession) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA20.

[2334] Spondyloepiphyseal dysplasia, late (SEDL, Accession NM_014563.1) is another GAM30 target gene, herein designated TARGET GENE. SEDL BINDING SITE1 and SEDL BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SEDL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE1 and SEDL BINDING SITE2, designated SEQ ID:8461 and SEQ ID:7862 respectively, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2335] Another function of GAM30 is therefore inhibition of Spondyloepiphyseal dysplasia, late (SEDL, Accession NM_014563.1), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. and therefore may be associated with Spondyloepiphyseal dysplasia. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Spondyloepiphyseal dysplasia, and of other diseases and clinical conditions associated with SEDL.

[2336] The function of SEDL has been established by previous studies. Gedeon et al. (2001) reviewed the spectrum of mutations found in 30 of 36 unrelated cases of X- linked SEDL ascertained from different ethnic populations. It brought the total number of different disease- associated mutations to 21 and showed that they were distributed throughout the SEDL gene. Four recurrent mutations accounted for 13 of the 30 (43%). Haplotype analyses and the diverse ethnic origins of the patients supported recurrent mutations. Two patients with large deletions of SEDL exons were found, 1 with childhood onset of painful complications, the other relatively free of additional symptoms. Since no clear genotype/phenotype correlation could be established, they concluded that the complete

unaltered SEDL gene product is essential for normal bone growth. Christie et al. (2001) characterized the SEDL mutations in 4 unrelated spondyloepiphyseal dysplasia tarda kindreds of European origin. They identified 2 nonsense and 2 intragenic deletional frameshift mutations. The nonsense mutations occurred in exons 4 and 6. Both of the intragenic deletions, which were approximately 750 and 1300 to 1445 bp in size, involved intron 5 and part of exon 6 and resulted in frameshifts that led to premature termination signals.

[2337]

[2338] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2339] Christie, P. T.; Curley, A.; Nesbit, M. A.; Chapman, C.; Genet, S.; Harper, P. S.; Keeling, S. L.; Wilkie, A. O. M.; Winter, R. M.; Thakker, R. V. : Mutational analysis in X-linked spondyloepiphyseal dysplasia tarda. J. Clin. Endocr. Metab. 86: 3233- 3236, 2001. ; and

[2340] Gedeon, A. K.; Tiller, G. E.; Le Merrer, M.; Heuertz, S.; Tranebjaerg, L.; Chitayat, D.; Robertson, S.; Glass, I. A.; Savarirayan, R.; Cole, W. G.; Rimoin, D. L.; Kousseff, B. G.; Ohas.

[2341] Further studies establishing the function and utilities of SEDL are found in John Hopkins OMIM database record ID 300202, and in cited publications listed in Table 5, which are hereby incorporated by reference.Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NM_022978.1) is another GAM30 target gene, herein designated TARGET GENE. SERF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE, designated SEQ ID:18696, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2342] Another function of GAM30 is therefore inhibition of Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NM_022978.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B.

[2343] Tal1 (scl) interrupting locus (SIL, Accession NM_003035.1) is another GAM30 target gene, herein designated TARGET GENE. SIL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIL, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIL BINDING SITE, designated SEQ ID:14916, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2344] Another function of GAM30 is therefore inhibition of Tal1 (scl) interrupting locus (SIL, Accession NM_003035.1), a gene which may be required for axial development and left- right specification and therefore may be associated with Prominent midline neural tube defects, abnormal left- right development. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Prominent midline neural tube defects, abnormal left- right development, and of other diseases and clinical conditions associated with SIL.

[2345] The function of SIL has been established by previous studies. Aplan et al. (1997) demonstrated that transgenic mice in which inappropriately expressed scl protein, driven by sil regulatory elements, developed aggressive T-cell malignancies in collaboration with a misexpressed LMO1 (OMIM Ref. No. 186921) protein, thus recapitulating the situation seen in a subset of human T- cell ALL. Aplan

et al. (1997) also demonstrated that inappropriately expressed scl can interfere with the development of other tissues derived from mesoderm. Finally, Aplan et al. (1997) demonstrated that an scl construct lacking the scl transactivation domain collaborates with misexpressed LMO1, demonstrating that the scl transactivation domain is dispensable for oncogenesis, and supporting the hypothesis that the scl gene product exerts its oncogenic action through a dominant- negative mechanism.

[2346] Animal model experiments lend further support to the function of SIL. Izraeli et al. (1999) disrupted the Sil gene in mouse by homologous recombination. Heterozygotes were normal but mutant homozygotes died in utero after embryonic day 10.5. Between embryonic days 7.5 and 8.5, striking developmental anomalies appeared in Sil - /- embryos. In addition to reduced size and limited developmental progress compared to wildtype embryos, Sil mutants displayed prominent midline neural tube defects. These included delay or failure of neural tube closure and holoprosencephaly (OMIM Ref. No. 236100). In addition, left- right development was abnormal. In heterozygous and wildtype embryos, the embryonic heart tube always loops to the right, whereas in Sil mutants the direction of

heart looping is randomized. Nodal (OMIM Ref. No. 601265), lefty- 2 (OMIM Ref. No. 603037) and Pitx2 (OMIM Ref. No. 601542) are normally expressed only in the left lateral- plate mesoderm before heart looping, with continued expression of Pitx2 on the left side of the looping heart tube. In contrast, Sil mutants showed bilaterally symmetric expression of nodal and Pitx2 at all stages examined. For lefty- 2, most Sil - /- embryos also showed bilaterally symmetric expression. However, a small number of mutants expressed lefty- 2 only on the right. Expression of both Patched (OMIM Ref. No. 601309) and Gli1 (OMIM Ref. No. 165220) was greatly reduced in Sil - /- embryos. Shh (OMIM Ref. No. 600725) and Hnf3b (OMIM Ref. No. 600288) were expressed in the notochord of Sil mutants. However, the markedly reduced expression of their target genes indicated that Shh signaling in the midline may be blocked in Sil - /- embryos. Comparison with Shh mutant embryos, which have axial defects but normal cardiac looping, indicated that the consequences of abnormal midline development for left- right patterning depend on the time of onset, duration, and severity of disruption of the normal asymmetric patterns of expression of nodal, lefty- 2, and Pitx2.

[2347] It is appreciated that the abovementioned animal model for SIL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2348] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2349] Aplan, P. D.; Jones, C. A.; Chervinsky, D. S.; Zhao, X.; Ellsworth, M.; Wu, C.; McGuire, E. A.; Gross, K. W. : An scl gene product lacking the transactivation domain induces bony abnormalities and cooperates with LMO1 to generate T- cell malignancies in transgenic mice. EMBO J. 16: 2408- 2419, 1997. ; and

[2350] Izraeli, S.; Lowe, L. A.; Bertness, V. L.; Good, D. J.; Dorward, D. W.; Kirsch, I. R.; Kuehn, M. R. : The SIL gene is required for mouse embryonic axial development and left-right spec.

[2351] Further studies establishing the function and utilities of SIL are found in John Hopkins OMIM database record ID 181590, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NM_005073.1) is another GAM30 target gene,

herein designated TARGET GENE. SLC15A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC15A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:18389, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2352] Another function of GAM30 is therefore inhibition of Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NM_005073.1), a gene which is a H(+)- coupled peptide transporter. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC15A1.

[2353] The function of SLC15A1 has been established by previous studies. In mammalian small intestine, the proton-coupled peptide transporter is responsible for the absorption of small peptides arising from digestion of dietary proteins. Fei et al. (1994) isolated a cDNA clone encoding a hydrogen ion/peptide cotransporter from a rabbit intestinal cDNA library. Liang et al. (1995) screened a human intestinal cDNA library with a probe derived from the

rabbit cotransporter cDNA and identified a cDNA which, when expressed in HeLa cells or in Xenopus laevis oocytes, induced proton- dependent peptide transport activity. The predicted protein consisted of 708 amino acids with 12 membrane- spanning domains and 2 putative sites for protein kinase C- dependent phosphorylation. The cDNA- induced transport process accepted dipeptides, tripeptides, and amino beta- lactam antibiotics as substrates, but could not transport free amino acids. The human cotransporter showed 81% identity and 92% similarity to the rabbit cotransporter, but showed only a weak homology to the proton- coupled peptide transport proteins present in bacteria and yeast. By analysis of somatic cell hybrids and by isotopic in situ hybridization, Liang et al. (1995) mapped the human gene to 13q33- q34. Adibi (1997) reviewed the biology and function of the human intestinal oligopeptide transporter, which he symbolized PEPT1. Studies indicated that it transports dipeptides and tripeptides but not free amino acids or peptides with more than 3 amino acid residues and that its driving force for uphill transport requires proton binding and presence of an inside- negative membrane potential. A membrane protein, HTP1, which ap-

peared to be associated with the oligopeptide transporter, had also been cloned. Adibi (1997) pointed out the importance of the transporter in nutritional and pharmacologic therapies; for example, it has allowed the use of oligopeptides as a source of nitrogen for enteral feeding and the use of the oral route for delivery of peptidomimetic drugs such as beta- lactam antibiotics.

[2354]

[2355] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2356] Liang, R.; Fei, Y.- J.; Prasad, P. D.; Ramamoorthy, S.; Han, H.; Yang- Feng, T. L.; Hediger, M. A.; Ganapathy, V.; Leibach, F. H. : Human intestinal H(+)/peptide cotransporter: cloning, functional expression, and chromosomal localization. J. Biol. Chem. 270: 6456- 6463, 1995. ; and

[2357] Adibi, S. A. : The oligopeptide transporter (Pept- 1) in human intestine: biology and function. Gastroenterology 113: 332- 340, 1997.

[2358] Further studies establishing the function and utilities of SLC15A1 are found in John Hopkins OMIM database record ID 600544, and in cited publications listed in Table 5, which are hereby incorporated by refer-

ence.Synaptosomal-associated protein, 23kda (SNAP23, Accession NM_003825.2) is another GAM30 target gene, herein designated TARGET GENE. SNAP23 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNAP23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE, designated SEQ ID:12976, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2359] Another function of GAM30 is therefore inhibition of Synaptosomal-associated protein, 23kda (SNAP23, Accession NM_003825.2), a gene which is essential component of the high affinity receptor for the general membrane fusion machinery. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23.

[2360] The function of SNAP23 has been established by previous studies. Synaptosomal- associated proteins (SNAPs) are involved in the process of membrane fusion in intracellular vesicle traffic. By fluorescence in situ hybridization, Lazo et al. (2001) mapped the SNAP23 gene to chromo-

some 15q21- q22. Lazo et al. (2001) suggested that alterations in the SNAP23 gene may be involved in neurologic and other diseases with defects in vesicle- membrane fusion processes that map to 15q15- q21.

[2361]

[2362] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2363] Lazo, P. A.; Nadal, M.; Ferrer, M.; Area, E.; Hernandez-Torres, J.; Nabokina, S. M.; Mollinedo, F.; Estivill, X. : Genomic organization, chromosomal localization, alternative splicing, and isoforms of the human synaptosome- associated protein- 23 gene implicated in vesicle- membrane fusion processes. Hum. Genet. 108: 211- 215, 2001. ; and

[2364] Mollinedo, F.; Lazo, P. A. : Identification of two isoforms of the vesicle- membrane fusion protein SNAP- 23 in human neutrophils and HL- 60 cells. Biochem. Biophys. Res. Commun. 231: 808.

[2365] Further studies establishing the function and utilities of SNAP23 are found in John Hopkins OMIM database record ID 602534, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-cell acute

lymphocytic leukemia 1 (TAL1, Accession NM_003189.1) is another GAM30 target gene, herein designated TARGET GENE. TAL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TAL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:4348, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2366] Another function of GAM30 is therefore inhibition of T-cell acute lymphocytic leukemia 1 (TAL1, Accession NM_003189.1), a gene which may help control cell growth and differentiation. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAL1.

[2367] The function of TAL1 has been established by previous studies. Finger et al. (1989) analyzed a t(1;14)(p32;q11) chromosomal translocation in a lymphohemopoietic stem cell line derived from a patient with acute T- lymphoblastic leukemia (Kurtzberg et al., 1985). The chromosomal joining of 14 to 1p occurred at the T- cell receptor delta diversity (D- delta- 2) segment, and the reciprocal joining

on chromosome 14 occurred at the T- cell delta diversity segment D- delta- 1. Involvement of delta diversity segments at the translocation junctions suggested that the translocation occurred during an attempt at delta-1/delta- 2 joining in a stem cell. Finger et al. (1989) found that the segment of chromosome 1 at band p32, adjacent to the chromosomal breakpoint, encodes a transcriptional unit designated TCL5. Finger et al. (1989) also demonstrated a rearrangement of the TCL5 locus in a human melanoma cell line carrying a deletion at 1p32. The occurrence of 'biphenotypic' leukemias with lymphoid and myeloid characteristics and evidence of stem cell origin of myeloid, erythroid, megakaryocytic, and lymphoid lineages in chronic myeloid leukemia suggested that leukemias may arise from pluripotent hematopoietic cells. Begley et al. (1989) studied a leukemic stem cell line that was capable of differentiating into either myeloid or lymphoid cells and that carried a translocation between chromosomes 1 and 14, t(1;14)(p33;q11). By means of molecular cloning and sequencing, they showed that as a consequence of the translocation an unusual fusion transcript was generated. The chromosome 1 region involved in the breakpoint was the site of transcriptional activity appar-

ently occurring only in hematopoietic tissues. Begley et al. (1989) concluded that the translocation may identify a gene located on chromosome 1 which is important for hematopoietic development and oncogenesis. They suggested the designation SCL (stem cell leukemia hematopoietic transcription factor).

[2368]

[2369] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2370] Begley, C. G.; Aplan, P. D.; Davey, M. P.; Nakahara, K.; Tchorz, K.; Kurtzberg, J.; Hershfield, M. S.; Haynes, B. F.; Cohen, D. I.; Waldmann, T. A.; Kirsch, I. R. : Chromosomal translocation in a human leukemic stem- cell line disrupts the T- cell antigen receptor delta- chain diversity region and results in a previously unreported fusion transcript. Proc. Nat. Acad. Sci. 86: 2031- 2035, 1989. ; and

[2371] Finger, L. R.; Kagan, J.; Christopher, G.; Kurtzberg, J.; Hershfield, M. S.; Nowell, P. C.; Croce, C. M. : Involvement of the TCL5 gene on human chromosome 1 in T- cell leukemia and mel.

[2372] Further studies establishing the function and utilities of TAL1 are found in John Hopkins OMIM database record ID

187040, and in cited publications listed in Table 5, which are hereby incorporated by reference.Thromboxane a2 receptor (TBXA2R, Accession NM_001060.2) is another GAM30 target gene, herein designated TARGET GENE. TBXA2R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBXA2R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:3670, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2373] Another function of GAM30 is therefore inhibition of Thromboxane a2 receptor (TBXA2R, Accession NM_001060.2), a gene which activates Ca2+- activated chloride channels; stimulates platelet aggregation and smooth muscle constriction and therefore may be associated with Bleeding disorder. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Bleeding disorder, and of other diseases and clinical conditions associated with TBXA2R.

[2374] The function of TBXA2R has been established by previous studies. Thromboxane A2 (TXA2), an arachidonate

metabolite, is a potent stimulator of platelet aggregation and a constrictor of vascular and respiratory smooth muscles. It has been implicated as a mediator in diseases such as myocardial infarction, stroke, and bronchial asthma. Ushikubi et al. (1989) purified the cell surface receptor for TXA2, using a stable analog of TXA2. Using an oligonucleotide probe corresponding to its partial amino acid sequence, Hirata et al. (1991) obtained a cDNA encoding the receptor from human placenta and a partial cDNA clone from cultured human megakaryocytic leukemia cells. The placenta cDNA encoded a protein of 343 amino acids with 7 putative transmembrane domains. The protein expressed in COS- 7 cells bound drugs with affinities identical to those of the platelet receptor, and that expressed in Xenopus oocytes opened calcium- ion- activated chloride channels on agonist stimulation. Northern blot analysis and nucleotide sequences of the 2 clones suggested that an identical form of thromboxane A2 receptor is present in platelets and vascular tissues.

[2375] Animal model experiments lend further support to the function of TBXA2R. The actions of TXA2 are mediated by G protein- coupled thromboxane- prostanoid (TP) receptors. TP receptors have been implicated in the pathogene-

sis of cardiovascular diseases. To investigate the physiologic functions of TP receptors, Thomas et al. (1998) generated TP receptor- deficient mice by gene targeting. Tp -/- animals reproduced and survived in expected numbers, and their major organ systems were normal. Thromboxane agonist binding could not be detected in tissues from Tp -/- mice. Bleeding times were prolonged in these mice and their platelets did not aggregate after exposure to TXA2 agonists. Aggregation responses after collagen stimulation were also delayed, although ADP- stimulated aggregation was normal. In summary, Tp -/- mice had a mild bleeding disorder and altered vascular responses to TXA2 and arachidonic acid. Their studies suggested that most of the recognized functions of TXA2 are mediated by the single known Tp gene locus.

[2376] It is appreciated that the abovementioned animal model for TBXA2R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2377] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2378] Hirata, M.; Hayashi, Y.; Ushikubi, F.; Yokota, Y.; Kageyama,

R.; Nakanishi, S.; Narumiya, S. : Cloning and expression of cDNA for a human thromboxane A2 receptor. Nature 349: 617- 620, 1991. ; and

[2380] Further studies establishing the function and utilities of TBXA2R are found in John Hopkins OMIM database record ID 188070, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-cell leukemia/lymphoma 6 (TCL6, Accession NM_020553.2) is another GAM30 target gene, herein designated TARGET GENE. TCL6 BINDING SITE1 and TCL6 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TCL6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:16523 and SEQ ID:8729 respectively, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2381] Another function of GAM30 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession NM_020553.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[2382] Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NM_003212.1) is another GAM30 target gene, herein designated TARGET GENE. TDGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TDGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TDGF1 BINDING SITE, designated SEQ ID:14244, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2383] Another function of GAM30 is therefore inhibition of Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NM_003212.1), a gene which can play a role in the determination of the epiblastic cells that subsequently give rise to the mesoderm. and therefore may be associated with Forebrain defects. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Forebrain defects, and of other diseases and clinical conditions associated

with TDGF1.

[2384] The function of TDGF1 has been established by previous studies. Cryptic protein is required for proper laterality development in humans. TDGF1, like CFC1, is an EGF-CFC family member and an obligate coreceptor involved in NODAL signaling, a developmental program implicated in midline, forebrain, and left- right axis development in model organisms. A mutation in the conserved CFC domain of the TDGF1 gene (187395.0001) was demonstrated by de la Cruz et al. (2002) in a patient with midline anomalies of the forebrain. The mutant protein was inactive in a zebrafish rescue assay, indicating a role for TDGF1 in human midline and forebrain development. From a teratocarcinoma cell line, Ciccodicola et al. (1989) isolated a human cDNA (referred to as CRIPTO by them) encoding a protein of 188 amino acids. The central portion of this protein shared structural similarities with the human transforming growth factor alpha (OMIM Ref. No. 190170) and epidermal growth factor (EGF; 131530). Northern blot analysis of a wide variety of tumor and normal cell lines and tissues showed that CRIPTO transcripts are detected only in undifferentiated cells and disappear after cell differentiation induced by retinoic acid treat-

ment.

[2385]

[2386] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2387] de la Cruz, J. M.; Bamford, R. N.; Burdine, R. D.; Roessler, E.; Barkovich, A. J.; Donnai, D.; Schier, A. F.; Muenke, M. : A loss- of- function mutation in the CFC domain of TDGF1 is associated with human forebrain defects. Hum. Genet. 110: 422- 428, 2002. ; and

[2388] Ciccodicola, A.; Dono, R.; Obici, S.; Simeone, A.; Zollo, M.; Persico, M. G. : Molecular characterization of a gene of the 'EGF family' expressed in undifferentiated human NTERA2 terato.

[2389] Further studies establishing the function and utilities of TDGF1 are found in John Hopkins OMIM database record ID 187395, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tumor necrosis factor, alpha-induced protein 2 (TNFAIP2, Accession NM_006291.2) is another GAM30 target gene, herein designated TARGET GENE. TNFAIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFAIP2, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFAIP2 BINDING SITE, designated SEQ ID:14761, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2390] Another function of GAM30 is therefore inhibition of Tumor necrosis factor, alpha-induced protein 2 (TNFAIP2, Accession NM_006291.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP2.

[2391] Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NM_147187.1) is another GAM30 target gene, herein designated TARGET GENE. TNFRSF10B BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TNFRSF10B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:1494, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2392] Another function of GAM30 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NM_147187.1), a gene which forms complex that induces apoptosis. and therefore may be associated with Squamous cell carcinoma . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Squamous cell carcinoma ., and of other diseases and clinical conditions associated with TNFRSF10B.

[2393] The function of TNFRSF10B has been established by previous studies. The 8p21 region contains a number of putative tumor suppressor genes and is a frequent site of translocations in head and neck tumors. Pai et al. (1998) determined the genomic structure of KILLER/DR5 and performed sequence analysis of all 10 coding exons in 20 primary head and neck cancers with allelic loss of 8p. To screen for a subset of mutations localized to the functional cytoplasmic death domain, they sequenced this region in an additional 40 primary head and neck cancers. They found 2 alterations, including a 2- bp insertion at a minimal repeat site, introducing a premature stop codon and resulting in a truncated protein. This KILLER/DR5 mutation was also present in the germline of the affected patient, and the tumor did not have a p53 mutation by se-

quence analysis. Transfection studies in head and neck squamous cell carcinoma and colon and ovarian carcinoma cell lines revealed loss of growth suppressive function associated with the tumor- derived KILLER/DR5 truncation mutant. These observations provided the first evidence for mutation of a TRAIL death receptor gene in a human cancer, leading to loss of its apoptotic function. The second alteration identified by Pai et al. (1998) was a single T- to- C point mutation at residue 1109 that resulted in an amino acid change from val to ala. This mutation was not present in the germline; however, sequence analysis of p53 in this tumor revealed a point mutation of T to C in codon 242, resulting in a change from arg to cys. In a case of a head and neck squamous cell carcinoma (OMIM Ref. No. 601400), Pai et al. (1998) found a 2- bp insertion in the TNFRSF10B gene at a minimal repeat site (ACAC) at residue 1065, which introduced a premature stop codon and resulted in a truncated protein. Sequence analysis of normal tissue from the patient showed that the truncating mutation was also present in the germline, and that the tumor did not have a p53 mutation. A significant impairment in the ability of the truncation mutant to suppress colony formation was observed when mutant cDNA

was transfected into human colon and ovarian cancer cell lines. In the wildtype transfected cells, there was no observed colony survival; however, there was more than 50% colony growth in cells transfected with the tumor- derived mutant. Pai et al. (1998) suspected that the mutant retained partial function, because its overexpression in a background of cells containing the endogenous wildtype gene could further reduce the percentage of colony survival.

[2394]

[2395] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2396] Pai, S. I.; Wu, G. S.; Ozoren, N.; Wu, L.; Jen, J.; Sidransky, D.; El- Deiry, W. S. : Rare loss- of- function mutation of a death receptor gene in head and neck cancer. Cancer Res. 58: 3513- 3518, 1998. ; and

[2397] Screaton, G. R.; Mongkolsapaya, J.; Xu, X.- N.; Cowper, A. E.; McMichael, A. J.; Bell, J. I. : TRICK2, a new alternatively spliced receptor that transduces the cytotoxic signal from TRAIL.

[2398] Further studies establishing the function and utilities of TNFRSF10B are found in John Hopkins OMIM database

record ID 603612, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tumor necrosis factor receptor superfamily, member 11a, activator of nfkb (TNFRSF11A, Accession NM_003839.2) is another GAM30 target gene, herein designated TARGET GENE. TNFRSF11A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFRSF11A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF11A BINDING SITE, designated SEQ ID:4393, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2399] Another function of GAM30 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 11a, activator of nfkb (TNFRSF11A, Accession NM_003839.2) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF11A.

[2400] Torsin family 1, member b (torsin b) (TOR1B, Accession NM_014506.1) is another GAM30 target gene, herein designated TARGET GENE. TOR1B BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by TOR1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TOR1B BINDING SITE, designated SEQ ID:17084, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2401] Another function of GAM30 is therefore inhibition of Torsin family 1, member b (torsin b) (TOR1B, Accession NM_014506.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOR1B.

[2402] TUCAN (Accession NM_014959.1) is another GAM30 target gene, herein designated TARGET GENE. TUCAN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUCAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:19251, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2403] Another function of GAM30 is therefore inhibition of TU-

CAN (Accession NM_014959.1) . Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUCAN.

[2404] Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1) is another GAM30 target gene, herein designated TARGET GENE. WHSC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WHSC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:12757, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2405] Another function of GAM30 is therefore inhibition of Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1), a gene which binds covalently to and repairs g/t mismatches. and therefore may be associated with Wolf- hirschhorn syndrome. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of Wolf- hirschhorn syndrome, and of other diseases and clinical conditions associated with WHSC1.

[2406] The function of WHSC1 has been established by previous

studies. Wolf- Hirschhorn syndrome (WHS; 194190) is a malformation syndrome associated with a hemizygous deletion of the distal short arm of chromosome 4 (OMIM Ref. No. 4p16.3). The shortest region of overlap of the deletions observed in WHS patients, the WHS critical region, has been confined to a region of 165 kb (Wright et al., 1997). This region was sequenced completely during the search for the Huntington disease gene (Baxendale et al., 1993). Stec et al. (1998) described a novel developmental gene, two- thirds of which maps in the distal part of the WHS critical region. They designated the gene WHSC1 (Wolf- Hirschhorn syndrome candidate- 1). The WHSC1 gene was identified initially through its high similarity to the translation product of an expressed sequence tag, located in the 165- kb WHCR, with the SET domain (see OMIM Ref. No. 600960) of the Drosophila protein ASH1 (OMIM Ref. No. 100790). The SET domain is found in proteins that are involved in embryonic development. The 25- exon WHSC1 gene was found to be expressed ubiquitously in early development and to undergo complex alternative splicing and differential polyadenylation. It encodes a 136- kD protein containing 4 domains present in other developmental proteins: a PWWP domain,

an HMG box, a SET domain also found in the Drosophila dysmorphy gene ash- encoded protein, and a PHD- type zinc finger. It is expressed preferentially in rapidly growing embryonic tissues, in a pattern corresponding to affected organs in WHS patients. The nature of the protein motifs, the expression pattern, and its mapping to the critical region led Stec et al. (1998) to propose WHSC1 as a good candidate gene to be responsible for many of the phenotypic features of WHS. Stec et al. (1998) noted that the t(4;14)(p16.3;q32.3) translocations described in a significant fraction of multiple myelomas (Richelda et al., 1997; Chesi et al., 1997) have breakpoints located less than 100 kb centromeric of the FGFR3 gene (OMIM Ref. No. 134934) on 4p16.3. They found that at least 3 of the breakpoints merged the immunoglobulin heavy- chain gene (IGHG1; 147100) on chromosome 14 with the WHSC1 gene. This fusion of genes and their untimely expression in the myeloid lineage driven from the 5- prime IgH enhancer may indicate that WHSC1- encoded proteins are involved in the clinical heterogeneity of multiple myeloma.

[2407]

[2408] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[2409] Chesi, M.; Nardini, E.; Brents, L. A.; Schrock, E.; Ried, T.; Kuehl, W. M.; Bergsagel, P. L. : Frequent translocation t(4;14)(p16.3;q32.3) in multiple myeloma is associated with increased expression and activating mutations of fibroblast growth factor receptor 3. Nature Genet. 16: 260-264, 1997. ; and

[2410] Richelda, R.; Ronchetti, D.; Baldini, L.; Cro, L.; Viggiano, L.; Marzella, R.; Rocchi, M.; Otsuki, T.; Lombardi, L.; Maiolo, A. T.; Neri, A. : A novel chromosomal translocation t(4;14)(p16.

[2411] Further studies establishing the function and utilities of WHSC1 are found in John Hopkins OMIM database record ID 602952, and in cited publications listed in Table 5, which are hereby incorporated by reference.V-yes-1 yamaguchi sarcoma viral oncogene homolog 1 (YES1, Accession NM_005433.2) is another GAM30 target gene, herein designated TARGET GENE. YES1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by YES1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:3761, to the nucleotide sequence of GAM30 RNA, herein designated GAM RNA, also designated SEQ ID:346.

[2412] Another function of GAM30 is therefore inhibition of V-yes-1 yamaguchi sarcoma viral oncogene homolog 1 (YES1, Accession NM_005433.2), a gene which is a putative protein- tyrosine kinase. Accordingly, utilities of GAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1.

[2413] The function of YES1 has been established by previous studies. The YES oncogene is homologous to the gene of the Yamaguchi sarcoma virus. The product of the gene is associated with tyrosine- specific protein kinase activity and its amino acid sequence shows a high degree of homology with that of the SRC gene product of Rous sarcoma virus. Semba et al. (1985) found in DNA from human embryo fibroblasts 10 EcoRI fragments that hybridized with the Yamaguchi sarcoma virus oncogene. Four of these (designated YES1) were assigned to chromosome 18 and 1 (designated YES2) was assigned to chromosome 6 by a study of human- mouse cell hybrids. (YES2 was later found (Semba et al., 1988) to be a pseudogene of YES1 and to be located at 22q11.2. Semba et al. (1988) stated:

'The failure of proper mapping in our earlier experiment might have been caused by instability of hybrid cell clones.') The other 5 fragments could not be mapped either because hybridization signals were too weak or differentiation from mouse YES fragments was impossible. There was evidence for multiple copies of YES- related genes in the human genome, but only a single RNA species, 4.8 kb long, was found. At least 3 of the human YES gene copies had both introns and exons and 1 gene copy appeared to be a pseudogene. By isotopic in situ hybridization, Yoshida et al. (1985) mapped the YES1 gene to 18q21.3. These workers suggested that the localization is consistent with a role in the pathogenesis of follicular lymphoma, which is frequently associated with a 14;18 translocation with the breakpoint at 18q21 (Fukuhara et al., 1979); see 151430. Ohno et al. (1987) found that although it is in the same chromosome region as BCL2 (OMIM Ref. No. 151430), the YES gene is intact in cases of follicular lymphoma. Using yeast artificial chromosomes (YACs) containing the YES1 gene as probes and fluorescence in situ hybridization, Silverman et al. (1993) detected a strong signal in the region corresponding to 18p11.3. These YACs were found to contain another

18p11.32 gene, thymidylate synthase (OMIM Ref. No. 188350); the genes were less than 50 kb apart. Overhauser et al. (1993) identified a sequence tagged site (STS) in the YES1 gene and used it in studies of somatic cell hybrids with deletion of various segments of chromosome 18 to map the gene to 18pter- p11.21.

[2414]

[2415] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2416] Semba, K.; Yamanashi, Y.; Nishizawa, M.; Sukegawa, J.; Yoshida, M.; Sasaki, M.; Yamamoto, T.; Toyoshima, K. : Location of the c- yes gene on the human chromosome and its expression in various tissues. Science 227: 1038-1040, 1985. ; and

[2417] Overhauser, J.; Mewar, R.; Rojas, K.; Lia, K.; Kline, A. D.; Silverman, G. A. : STS map of genes and anonymous DNA fragments on human chromosome 18 using a panel of somatic cell hybrids.

[2418] Further studies establishing the function and utilities of YES1 are found in John Hopkins OMIM database record ID 164880, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[2419] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 31 (GAM31), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[2420] GAM31 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM31 was detected is described hereinabove with reference to Figs. 8-15.

[2421] GAM31 gene, herein designated GAM GENE, and GAM31 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2422] GAM31 gene encodes a GAM31 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM31 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM31 precursor RNA is designated SEQ ID:118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:118 is located at position 57935221 relative to chromosome 12.

[2423] GAM31 precursor RNA folds onto itself, forming GAM31

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2424] GAM31 precursor RNA folds onto itself, forming GAM31 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2425] Nucleotide sequence of GAM31 precursor RNA, designated SEQ-ID: 118, and a schematic representation of a predicted secondary folding of GAM31 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2426] An enzyme complex designated DICER COMPLEX, `dices`

the GAM31 folded precursor RNA into GAM31 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM31 RNA is designated SEQ ID:250, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2427] GAM31 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM31 target RNA, herein designated GAM TARGET RNA. GAM31 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2428] GAM31 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM31 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM31

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM31 RNA may have a different number of target binding sites in untranslated regions of a GAM31 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2429] The complementary binding of GAM31 RNA, herein designated GAM RNA, to target binding sites on GAM31 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM31 target RNA into GAM31 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2430] It is appreciated that GAM31 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM31 target genes. The mRNA of each one of this plurality of GAM31 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM31 RNA, herein designated GAM RNA, and which when bound by GAM31 RNA causes inhibition of translation of respective one or more GAM31 target proteins.

[2431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM31 gene, herein designated GAM GENE, on one or more GAM31 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[2432] It is appreciated that specific functions and accordingly utilities of GAM31 correlate with, and may be deduced from, the identity of the target genes which GAM31 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2433]

[2434]

[2435] (Accession NP_444285.1) is a GAM31 target gene, herein designated TARGET GENE. BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BINDING SITE, designated SEQ ID:12532, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2436] A function of GAM31 is therefore inhibition of (Accession NP_444285.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with .

[2437] Acidic repeat containing (ACRC, Accession NP_443189.1)

is another GAM31 target gene, herein designated TARGET GENE. ACRC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACRC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACRC BINDING SITE, designated SEQ ID:8811, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2438] Another function of GAM31 is therefore inhibition of Acidic repeat containing (ACRC, Accession NP_443189.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACRC.

[2439] Reserved (ASRGL1, Accession NP_079356.2) is another GAM31 target gene, herein designated TARGET GENE. ASRGL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASRGL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASRGL1 BINDING SITE, designated SEQ ID:8589, to the nucleotide sequence of GAM31 RNA, herein designated GAM

RNA, also designated SEQ ID:250.

[2440] Another function of GAM31 is therefore inhibition of Reserved (ASRGL1, Accession NP_079356.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASRGL1.

[2441] Ataxia telangiectasia mutated (includes complementation groups a, c and d) (ATM, Accession NP_612150.1) is another GAM31 target gene, herein designated TARGET GENE. ATM BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATM BINDING SITE, designated SEQ ID:12329, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2442] Another function of GAM31 is therefore inhibition of Ataxia telangiectasia mutated (includes complementation groups a, c and d) (ATM, Accession NP_612150.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with ATM.

[2443] BA526D8.4 (Accession XP_046861.2) is another GAM31 target gene, herein designated TARGET GENE. BA526D8.4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BA526D8.4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BA526D8.4 BINDING SITE, designated SEQ ID:10428, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2444] Another function of GAM31 is therefore inhibition of BA526D8.4 (Accession XP_046861.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA526D8.4.

[2445] B-cell cll/lymphoma 7b (BCL7B, Accession NP_001698.2) is another GAM31 target gene, herein designated TARGET GENE. BCL7B BINDING SITE1 and BCL7B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BCL7B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of BCL7B BINDING SITE1 and BCL7B BINDING SITE2, designated SEQ ID:12161 and SEQ ID:18017 respectively, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2446] Another function of GAM31 is therefore inhibition of B-cell cll/lymphoma 7b (BCL7B, Accession NP_001698.2), a gene which is of yet unknown fanction and therefore may be associated with Williams- beuren syndrome. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of Williams- beuren syndrome, and of other diseases and clinical conditions associated with BCL7B.

[2447] The function of BCL7B has been established by previous studies. Meng et al. (1998) constructed a physical map encompassing the 1.5- Mb region of chromosome 7q11.23 that is commonly deleted in Williams- Beuren syndrome (WBS; 194050). They identified 3 genes within this region, including BCL7B, which contains 6 exons. By EST database searching, screening of a liver cDNA library, and sequencing, they cloned a BCL7B cDNA encoding a deduced 202- amino acid protein that shows high homology to the BCL7A gene (OMIM Ref. No. 601406), which was cloned from a complex chromosomal translocation in

Burkitt lymphoma cell lines. BCL7B is highly conserved from C. elegans to human, suggesting that it has been conserved through evolution.

[2448]

[2449] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2450] Jadayel, D. M.; Osborne, L. R.; Coignet, L. J. A.; Zani, V. J.; Tsui, L.- C.; Scherer, S. W.; Dyer, M. J. S. : The BCL7 gene family: deletion of BCL7B in Williams syndrome. Gene 224: 35- 44, 1998. ; and

[2451] Meng, X.; Lu, X.; Li, Z.; Green, E. D.; Massa, H.; Trask, B. J.; Morris, C. A.; Keating, M. T. : Complete physical map of the common deletion region in Williams syndrome and identificat.

[2452] Further studies establishing the function and utilities of BCL7B are found in John Hopkins OMIM database record ID 605846, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome 1 open reading frame 22 (C1orf22, Accession NP_079467.2) is another GAM31 target gene, herein designated TARGET GENE. C1orf22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by C1orf22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:17483, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2453] Another function of GAM31 is therefore inhibition of Chromosome 1 open reading frame 22 (C1orf22, Accession NP_079467.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22.

[2454] Chromosome 21 open reading frame 108 (C21orf108, Accession XP_114191.2) is another GAM31 target gene, herein designated TARGET GENE. C21orf108 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf108, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:1584, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2455] Another function of GAM31 is therefore inhibition of Chromosome 21 open reading frame 108 (C21orf108, Accession XP_114191.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108.

[2456] Chromosome 6 open reading frame 33 (C6orf33, Accession NP_588608.1) is another GAM31 target gene, herein designated TARGET GENE. C6orf33 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:8970, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2457] Another function of GAM31 is therefore inhibition of Chromosome 6 open reading frame 33 (C6orf33, Accession NP_588608.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33.

[2458] Chemokine (c-c motif) ligand 15 (CCL15, Accession NP_116740.1) is another GAM31 target gene, herein des-

ignated TARGET GENE. CCL15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCL15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL15 BINDING SITE, designated SEQ ID:13409, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2459] Another function of GAM31 is therefore inhibition of Chemokine (c-c motif) ligand 15 (CCL15, Accession NP_116740.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCL15.

[2460] Chemokine (c-c motif) ligand 15 (CCL15, Accession NP_004158.1) is another GAM31 target gene, herein designated TARGET GENE. CCL15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCL15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL15 BINDING SITE, designated SEQ ID:13409, to the nu-

cleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2461] Another function of GAM31 is therefore inhibition of Chemokine (c-c motif) ligand 15 (CCL15, Accession NP_004158.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCL15.

[2462] Cd5 antigen-like (scavenger receptor cysteine rich family) (CD5L, Accession NP_005885.1) is another GAM31 target gene, herein designated TARGET GENE. CD5L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD5L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD5L BINDING SITE, designated SEQ ID:1774, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2463] Another function of GAM31 is therefore inhibition of Cd5 antigen-like (scavenger receptor cysteine rich family) (CD5L, Accession NP_005885.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD5L.

[2464] Chloride intracellular channel 6 (CLIC6, Accession NP_444507.1) is another GAM31 target gene, herein designated TARGET GENE. CLIC6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLIC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLIC6 BINDING SITE, designated SEQ ID:15773, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2465] Another function of GAM31 is therefore inhibition of Chloride intracellular channel 6 (CLIC6, Accession NP_444507.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC6.

[2466] Cyclic nucleotide gated channel alpha 3 (CNGA3, Accession NP_001289.1) is another GAM31 target gene, herein designated TARGET GENE. CNGA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNGA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNGA3 BINDING SITE, designated

SEQ ID:5811, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2467] Another function of GAM31 is therefore inhibition of Cyclic nucleotide gated channel alpha 3 (CNGA3, Accession NP_001289.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNGA3.

[2468] Chemokine (c-x-c motif) ligand 5 (CXCL5, Accession NP_002985.1) is another GAM31 target gene, herein designated TARGET GENE. CXCL5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL5 BINDING SITE, designated SEQ ID:1275, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2469] Another function of GAM31 is therefore inhibition of Chemokine (c-x-c motif) ligand 5 (CXCL5, Accession NP_002985.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL5.

[2470] DKFZP572C163 (Accession NP_149350.1) is another

GAM31 target gene, herein designated TARGET GENE. DKFZP572C163 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP572C163, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP572C163 BINDING SITE, designated SEQ ID:17529, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2471] Another function of GAM31 is therefore inhibition of DKFZP572C163 (Accession NP_149350.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP572C163.

[2472] Egf-like-domain, multiple 5 (EGFL5, Accession XP_098838.1) is another GAM31 target gene, herein designated TARGET GENE. EGFL5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EGFL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated

SEQ ID:14518, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2473] Another function of GAM31 is therefore inhibition of Egf-like-domain, multiple 5 (EGFL5, Accession XP_098838.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5.

[2474] FLJ10292 (Accession NP_060518.1) is another GAM31 target gene, herein designated TARGET GENE. FLJ10292 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10292, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10292 BINDING SITE, designated SEQ ID:2300, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2475] Another function of GAM31 is therefore inhibition of FLJ10292 (Accession NP_060518.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10292.

[2476] FLJ10785 (Accession XP_291008.1) is another GAM31 target gene, herein designated TARGET GENE. FLJ10785

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10785, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10785 BINDING SITE, designated SEQ ID:8309, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2477] Another function of GAM31 is therefore inhibition of FLJ10785 (Accession XP_291008.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10785.

[2478] FLJ14437 (Accession NP_115967.1) is another GAM31 target gene, herein designated TARGET GENE. FLJ14437 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14437, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:15994, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2479] Another function of GAM31 is therefore inhibition of

FLJ14437 (Accession NP_115967.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437.

[2480] FLJ25955 (Accession XP_092154.2) is another GAM31 target gene, herein designated TARGET GENE. FLJ25955 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25955, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25955 BINDING SITE, designated SEQ ID:586, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2481] Another function of GAM31 is therefore inhibition of FLJ25955 (Accession XP_092154.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25955.

[2482] FLJ38723 (Accession NP_776166.1) is another GAM31 target gene, herein designated TARGET GENE. FLJ38723 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38723, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ38723 BINDING SITE, designated SEQ ID:19912, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2483] Another function of GAM31 is therefore inhibition of FLJ38723 (Accession NP_776166.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38723.

[2484] FLJ38819 (Accession NP_665872.1) is another GAM31 target gene, herein designated TARGET GENE. FLJ38819 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38819, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38819 BINDING SITE, designated SEQ ID:12225, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2485] Another function of GAM31 is therefore inhibition of FLJ38819 (Accession NP_665872.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38819.

[2486] Fucosyltransferase 9 (alpha (1,3) fucosyltransferase)

(FUT9, Accession NP_006572.1) is another GAM31 target gene, herein designated TARGET GENE. FUT9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT9 BINDING SITE, designated SEQ ID:6340, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2487] Another function of GAM31 is therefore inhibition of Fucosyltransferase 9 (alpha (1,3) fucosyltransferase) (FUT9, Accession NP_006572.1), a gene which catalyzes alpha-1,3 glycosidic linkages. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT9.

[2488] The function of FUT9 has been established by previous studies. FUT9 is one of several alpha- 3- fucosyltransferases that can catalyze the last step in the biosynthesis of Lewis antigen, the addition of a fucose to precursor polysaccharides. FUT9 synthesizes the LeX oligosaccharide, which is expressed in organ buds progressing in mesenchyma during human embryogenesis.

[2489]

[2490] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2491] Cailleau- Thomas, A.; Coullin, P.; Candelier, J.- J.; Balanzino, L.; Mennesson, B.; Oriol, R.; Mollicone, R. : FUT4 and FUT9 genes are expressed early in human embryogenesis. Glycobiology 10: 789- 802, 2000. ; and

[2492] Kaneko, M.; Kudo, T.; Iwasaki, H.; Ikehara, Y.; Nishihara, S.; Nakagawa, S.; Sasaki, K.; Shiina, T.; Inoko, H.; Saitou, N.; Narimatsu, H. : Alpha- 1,3- fucoslytransferase (sic) IX (Fuc- T.

[2493] Further studies establishing the function and utilities of FUT9 are found in John Hopkins OMIM database record ID 606865, and in cited publications listed in Table 5, which are hereby incorporated by reference.KBRAS2 (Accession NP_060065.2) is another GAM31 target gene, herein designated TARGET GENE. KBRAS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KBRAS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KBRAS2 BINDING SITE, desig-

nated SEQ ID:703, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2494] Another function of GAM31 is therefore inhibition of KBRAS2 (Accession NP_060065.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KBRAS2.

[2495] Potassium inwardly-rectifying channel, subfamily j, member 10 (KCNJ10, Accession NP_002232.2) is another GAM31 target gene, herein designated TARGET GENE. KCNJ10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNJ10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:10380, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2496] Another function of GAM31 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 10 (KCNJ10, Accession NP_002232.2), a gene which may be responsible for potassium buffering action of glial cells in the brain. Accordingly, utilities of GAM31 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10.

[2497] The function of KCNJ10 has been established by previous studies. Potassium channels have been found in virtually all cells, and a large number of K(+) channel cDNAs have been cloned. They are generally classified into voltage-dependent (Kv) type (e.g., 176258 and 176264) and inwardly rectifying (Kir) type (e.g., 602106 and 600937). The former possesses 6 putative transmembrane regions, while the latter has 2 putative transmembrane regions. Doupnik et al. (1995) reported that Kir channels exhibit various physiologic functions, such as the maintenance of the resting membrane potential, the generation of prolonged action potentials, the modulation of cell excitability, and the transport of potassium ions. Takumi et al. (1995) reported that the K(AB)- 2/Kir4.1 inwardly rectifying K(+) channel of rat has an ATP- binding domain of Walker- type A motif in the C- terminal intracellular region and is expressed in brain and kidney. In situ hybridization demonstrated that it is expressed predominantly in glial cells of rat membrane but also in the retinal Muller glial cells and marginal cells of the inner ear. By interspecific backcross analysis, Tada et al. (1997) demon-

strated that the mouse gene encoding the glial inwardly rectifying potassium channel, symbolized Kcnj10 by them, maps to distal chromosome 1. Because of homology of this region of the mouse genome to human 1q, Tada et al. (1997) suggested that the putative human homolog, KCNJ10, maps to 1q

[2498]

[2499] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2500] Doupnik, C. A.; Davidson, N.; Lester, H. A. : The inward rectifier potassium channel family. Curr. Opin. Neurobiol. 5: 268- 277, 1995. ; and

[2501] Tada, Y.; Horio, Y.; Takumi, T.; Terayama, M.; Tsuji, L.; Copeland, N. G.; Jenkins, N. A.; Kurachi, Y. : Assignment of the glial inwardly rectifying potassium channel K(AB)-2/Kir4.1 (Kcn.

[2502] Further studies establishing the function and utilities of KCNJ10 are found in John Hopkins OMIM database record ID 602208, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0010 (Accession NP_055486.1) is another GAM31 target gene, herein designated TARGET GENE. KIAA0010 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0010, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0010 BINDING SITE, designated SEQ ID:2192, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2503] Another function of GAM31 is therefore inhibition of KIAA0010 (Accession NP_055486.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0010.

[2504] KIAA0152 (Accession NP_055545.1) is another GAM31 target gene, herein designated TARGET GENE. KIAA0152 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0152, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:10689, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2505] Another function of GAM31 is therefore inhibition of KIAA0152 (Accession NP_055545.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152.

[2506] KIAA0459 (Accession XP_027862.1) is another GAM31 target gene, herein designated TARGET GENE. KIAA0459 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:5812, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2507] Another function of GAM31 is therefore inhibition of KIAA0459 (Accession XP_027862.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459.

[2508] KIAA1559 (Accession XP_054472.2) is another GAM31 target gene, herein designated TARGET GENE. KIAA1559 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1559, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:528, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2509] Another function of GAM31 is therefore inhibition of KIAA1559 (Accession XP_054472.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559.

[2510] KIDINS220 (Accession XP_291015.1) is another GAM31 target gene, herein designated TARGET GENE. KIDINS220 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIDINS220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIDINS220 BINDING SITE, designated SEQ ID:13145, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2511] Another function of GAM31 is therefore inhibition of

KIDINS220 (Accession XP_291015.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIDINS220.

[2512] LARP (Accession NP_056130.1) is another GAM31 target gene, herein designated TARGET GENE. LARP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LARP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LARP BINDING SITE, designated SEQ ID:7293, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2513] Another function of GAM31 is therefore inhibition of LARP (Accession NP_056130.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARP.

[2514] Leucine zipper-ef-hand containing transmembrane protein 1 (LETM1, Accession NP_036450.1) is another GAM31 target gene, herein designated TARGET GENE. LETM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LETM1, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LETM1 BINDING SITE, designated SEQ ID:15302, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2515] Another function of GAM31 is therefore inhibition of Leucine zipper-ef-hand containing transmembrane protein 1 (LETM1, Accession NP_036450.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LETM1.

[2516] LOC138961 (Accession XP_071218.2) is another GAM31 target gene, herein designated TARGET GENE. LOC138961 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC138961, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC138961 BINDING SITE, designated SEQ ID:11374, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2517] Another function of GAM31 is therefore inhibition of

LOC138961 (Accession XP_071218.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138961.

[2518] LOC144438 (Accession XP_084860.1) is another GAM31 target gene, herein designated TARGET GENE. LOC144438 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144438, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:10309, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2519] Another function of GAM31 is therefore inhibition of LOC144438 (Accession XP_084860.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144438.

[2520] LOC145098 (Accession XP_085022.1) is another GAM31 target gene, herein designated TARGET GENE. LOC145098 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145098, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145098 BINDING SITE, designated SEQ ID:5430, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2521] Another function of GAM31 is therefore inhibition of LOC145098 (Accession XP_085022.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145098.

[2522] LOC145663 (Accession XP_096829.1) is another GAM31 target gene, herein designated TARGET GENE. LOC145663 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145663 BINDING SITE, designated SEQ ID:15718, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2523] Another function of GAM31 is therefore inhibition of LOC145663 (Accession XP_096829.1) . Accordingly, utili-

ties of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145663.

[2524] LOC145678 (Accession XP_096832.1) is another GAM31 target gene, herein designated TARGET GENE. LOC145678 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145678, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145678 BINDING SITE, designated SEQ ID:2590, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2525] Another function of GAM31 is therefore inhibition of LOC145678 (Accession XP_096832.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145678.

[2526] LOC146958 (Accession XP_097142.1) is another GAM31 target gene, herein designated TARGET GENE. LOC146958 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146958, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146958 BINDING SITE, designated SEQ ID:5431, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2527] Another function of GAM31 is therefore inhibition of LOC146958 (Accession XP_097142.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146958.

[2528] LOC151878 (Accession XP_087329.1) is another GAM31 target gene, herein designated TARGET GENE. LOC151878 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151878, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151878 BINDING SITE, designated SEQ ID:11456, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2529] Another function of GAM31 is therefore inhibition of LOC151878 (Accession XP_087329.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151878.

[2530] LOC157693 (Accession XP_088366.2) is another GAM31 target gene, herein designated TARGET GENE. LOC157693 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157693, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157693 BINDING SITE, designated SEQ ID:11401, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2531] Another function of GAM31 is therefore inhibition of LOC157693 (Accession XP_088366.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157693.

[2532] LOC219918 (Accession XP_166197.1) is another GAM31 target gene, herein designated TARGET GENE. LOC219918 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219918, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC219918 BINDING SITE, designated SEQ ID:7818, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2533] Another function of GAM31 is therefore inhibition of LOC219918 (Accession XP_166197.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219918.

[2534] LOC221981 (Accession XP_168344.1) is another GAM31 target gene, herein designated TARGET GENE. LOC221981 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221981, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221981 BINDING SITE, designated SEQ ID:8106, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2535] Another function of GAM31 is therefore inhibition of LOC221981 (Accession XP_168344.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221981.

[2536] LOC282958 (Accession XP_212615.1) is another GAM31 target gene, herein designated TARGET GENE. LOC282958 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282958, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282958 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2537] Another function of GAM31 is therefore inhibition of LOC282958 (Accession XP_212615.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282958.

[2538] LOC282989 (Accession XP_208472.1) is another GAM31 target gene, herein designated TARGET GENE. LOC282989 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282989, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC282989 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2539] Another function of GAM31 is therefore inhibition of LOC282989 (Accession XP_208472.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282989.

[2540] LOC283170 (Accession XP_208535.1) is another GAM31 target gene, herein designated TARGET GENE. LOC283170 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283170 BINDING SITE, designated SEQ ID:7739, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2541] Another function of GAM31 is therefore inhibition of LOC283170 (Accession XP_208535.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283170.

[2542] LOC283263 (Accession XP_208593.1) is another GAM31 target gene, herein designated TARGET GENE. LOC283263 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283263, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283263 BINDING SITE, designated SEQ ID:19000, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2543] Another function of GAM31 is therefore inhibition of LOC283263 (Accession XP_208593.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283263.

[2544] LOC283309 (Accession XP_208611.1) is another GAM31 target gene, herein designated TARGET GENE. LOC283309 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283309, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283309 BINDING SITE, designated SEQ ID:19230, to

the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2545] Another function of GAM31 is therefore inhibition of LOC283309 (Accession XP_208611.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283309.

[2546] LOC283495 (Accession XP_208697.1) is another GAM31 target gene, herein designated TARGET GENE. LOC283495 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283495, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283495 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2547] Another function of GAM31 is therefore inhibition of LOC283495 (Accession XP_208697.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283495.

[2548] LOC283538 (Accession XP_211082.1) is another GAM31

target gene, herein designated TARGET GENE. LOC283538 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283538, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283538 BINDING SITE, designated SEQ ID:19620, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2549] Another function of GAM31 is therefore inhibition of LOC283538 (Accession XP_211082.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283538.

[2550] LOC283550 (Accession XP_208740.1) is another GAM31 target gene, herein designated TARGET GENE. LOC283550 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283550, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283550 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:250.

[2551] Another function of GAM31 is therefore inhibition of LOC283550 (Accession XP_208740.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283550.

[2552] LOC283640 (Accession XP_208767.1) is another GAM31 target gene, herein designated TARGET GENE. LOC283640 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283640, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283640 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2553] Another function of GAM31 is therefore inhibition of LOC283640 (Accession XP_208767.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283640.

[2554] LOC283914 (Accession XP_211257.2) is another GAM31 target gene, herein designated TARGET GENE. LOC283914

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283914, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283914 BINDING SITE, designated SEQ ID:20102, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2555] Another function of GAM31 is therefore inhibition of LOC283914 (Accession XP_211257.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283914.

[2556] LOC284019 (Accession XP_211302.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284019 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284019, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284019 BINDING SITE, designated SEQ ID:14941, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2557] Another function of GAM31 is therefore inhibition of LOC284019 (Accession XP_211302.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284019.

[2558] LOC284324 (Accession XP_209151.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284324 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284324, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284324 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2559] Another function of GAM31 is therefore inhibition of LOC284324 (Accession XP_209151.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284324.

[2560] LOC284397 (Accession XP_209180.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284397 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC284397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284397 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2561] Another function of GAM31 is therefore inhibition of LOC284397 (Accession XP_209180.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284397.

[2562] LOC284453 (Accession XP_209215.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284453 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284453, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284453 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2563] Another function of GAM31 is therefore inhibition of

LOC284453 (Accession XP_209215.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284453.

[2564] LOC284455 (Accession XP_209218.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284455 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284455, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284455 BINDING SITE, designated SEQ ID:2443, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2565] Another function of GAM31 is therefore inhibition of LOC284455 (Accession XP_209218.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284455.

[2566] LOC284570 (Accession XP_211521.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284570 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284570, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284570 BINDING SITE, designated SEQ ID:17707, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2567] Another function of GAM31 is therefore inhibition of LOC284570 (Accession XP_211521.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284570.

[2568] LOC284673 (Accession XP_211591.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284673 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284673 BINDING SITE, designated SEQ ID:16822, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2569] Another function of GAM31 is therefore inhibition of LOC284673 (Accession XP_211591.1) . Accordingly, utili-

ties of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284673.

[2570] LOC284707 (Accession XP_211598.1) is another GAM31 target gene, herein designated TARGET GENE. LOC284707 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284707, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284707 BINDING SITE, designated SEQ ID:3831, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2571] Another function of GAM31 is therefore inhibition of LOC284707 (Accession XP_211598.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284707.

[2572] LOC285333 (Accession XP_209571.1) is another GAM31 target gene, herein designated TARGET GENE. LOC285333 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285333, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285333 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2573] Another function of GAM31 is therefore inhibition of LOC285333 (Accession XP_209571.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285333.

[2574] LOC285504 (Accession XP_209642.1) is another GAM31 target gene, herein designated TARGET GENE. LOC285504 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285504, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285504 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2575] Another function of GAM31 is therefore inhibition of LOC285504 (Accession XP_209642.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285504.

[2576] LOC285709 (Accession XP_209730.2) is another GAM31 target gene, herein designated TARGET GENE. LOC285709 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285709, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285709 BINDING SITE, designated SEQ ID:6281, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2577] Another function of GAM31 is therefore inhibition of LOC285709 (Accession XP_209730.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285709.

[2578] LOC285717 (Accession XP_211991.1) is another GAM31 target gene, herein designated TARGET GENE. LOC285717 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285717, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285717 BINDING SITE, designated SEQ ID:12265, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2579] Another function of GAM31 is therefore inhibition of LOC285717 (Accession XP_211991.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285717.

[2580] LOC285797 (Accession XP_212026.1) is another GAM31 target gene, herein designated TARGET GENE. LOC285797 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285797, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285797 BINDING SITE, designated SEQ ID:13675, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2581] Another function of GAM31 is therefore inhibition of LOC285797 (Accession XP_212026.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285797.

[2582] LOC285838 (Accession XP_209771.1) is another GAM31 target gene, herein designated TARGET GENE. LOC285838 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285838, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285838 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2583] Another function of GAM31 is therefore inhibition of LOC285838 (Accession XP_209771.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285838.

[2584] LOC285982 (Accession XP_209861.1) is another GAM31 target gene, herein designated TARGET GENE. LOC285982 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285982, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285982 BINDING SITE, designated SEQ ID:9426, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2585] Another function of GAM31 is therefore inhibition of LOC285982 (Accession XP_209861.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285982.

[2586] LOC286007 (Accession XP_212133.1) is another GAM31 target gene, herein designated TARGET GENE. LOC286007 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286007, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286007 BINDING SITE, designated SEQ ID:9960, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2587] Another function of GAM31 is therefore inhibition of LOC286007 (Accession XP_212133.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286007.

[2588] LOC286182 (Accession XP_209929.1) is another GAM31 target gene, herein designated TARGET GENE. LOC286182 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286182 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2589] Another function of GAM31 is therefore inhibition of LOC286182 (Accession XP_209929.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286182.

[2590] LOC286383 (Accession XP_210030.1) is another GAM31 target gene, herein designated TARGET GENE. LOC286383 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286383, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286383 BINDING SITE, designated SEQ ID:19230, to

the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2591] Another function of GAM31 is therefore inhibition of LOC286383 (Accession XP_210030.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286383.

[2592] LOC338739 (Accession XP_294690.1) is another GAM31 target gene, herein designated TARGET GENE. LOC338739 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338739, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338739 BINDING SITE, designated SEQ ID:15655, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2593] Another function of GAM31 is therefore inhibition of LOC338739 (Accession XP_294690.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338739.

[2594] LOC339187 (Accession XP_294842.1) is another GAM31

target gene, herein designated TARGET GENE. LOC339187 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339187, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339187 BINDING SITE, designated SEQ ID:12276, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2595] Another function of GAM31 is therefore inhibition of LOC339187 (Accession XP_294842.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339187.

[2596] LOC339807 (Accession XP_295070.1) is another GAM31 target gene, herein designated TARGET GENE. LOC339807 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339807, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339807 BINDING SITE, designated SEQ ID:13170, to the nucleotide sequence of GAM31 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:250.

[2597] Another function of GAM31 is therefore inhibition of LOC339807 (Accession XP_295070.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339807.

[2598] LOC340112 (Accession XP_291146.1) is another GAM31 target gene, herein designated TARGET GENE. LOC340112 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340112, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340112 BINDING SITE, designated SEQ ID:2443, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2599] Another function of GAM31 is therefore inhibition of LOC340112 (Accession XP_291146.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340112.

[2600] LOC340156 (Accession XP_291158.1) is another GAM31 target gene, herein designated TARGET GENE. LOC340156

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340156 BINDING SITE, designated SEQ ID:14005, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2601] Another function of GAM31 is therefore inhibition of LOC340156 (Accession XP_291158.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340156.

[2602] LOC348241 (Accession XP_300667.1) is another GAM31 target gene, herein designated TARGET GENE. LOC348241 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348241, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348241 BINDING SITE, designated SEQ ID:11369, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2603] Another function of GAM31 is therefore inhibition of LOC348241 (Accession XP_300667.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348241.

[2604] LOC348526 (Accession XP_300775.1) is another GAM31 target gene, herein designated TARGET GENE. LOC348526 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348526, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348526 BINDING SITE, designated SEQ ID:16926, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2605] Another function of GAM31 is therefore inhibition of LOC348526 (Accession XP_300775.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348526.

[2606] LOC348768 (Accession XP_302883.1) is another GAM31 target gene, herein designated TARGET GENE. LOC348768 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC348768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348768 BINDING SITE, designated SEQ ID:9248, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2607] Another function of GAM31 is therefore inhibition of LOC348768 (Accession XP_302883.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348768.

[2608] LOC349257 (Accession XP_300996.1) is another GAM31 target gene, herein designated TARGET GENE. LOC349257 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349257 BINDING SITE, designated SEQ ID:17529, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2609] Another function of GAM31 is therefore inhibition of

LOC349257 (Accession XP_300996.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349257.

[2610] LOC349258 (Accession XP_300995.1) is another GAM31 target gene, herein designated TARGET GENE. LOC349258 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349258 BINDING SITE, designated SEQ ID:17529, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2611] Another function of GAM31 is therefore inhibition of LOC349258 (Accession XP_300995.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349258.

[2612] LOC349265 (Accession XP_301000.1) is another GAM31 target gene, herein designated TARGET GENE. LOC349265 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349265, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349265 BINDING SITE, designated SEQ ID:17529, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2613] Another function of GAM31 is therefore inhibition of LOC349265 (Accession XP_301000.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349265.

[2614] LOC349266 (Accession XP_300999.1) is another GAM31 target gene, herein designated TARGET GENE. LOC349266 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349266 BINDING SITE, designated SEQ ID:17529, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2615] Another function of GAM31 is therefore inhibition of LOC349266 (Accession XP_300999.1) . Accordingly, utili-

ties of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349266.

[2616] LOC350905 (Accession XP_301844.1) is another GAM31 target gene, herein designated TARGET GENE. LOC350905 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC350905, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC350905 BINDING SITE, designated SEQ ID:607, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2617] Another function of GAM31 is therefore inhibition of LOC350905 (Accession XP_301844.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC350905.

[2618] LOC352739 (Accession XP_305938.1) is another GAM31 target gene, herein designated TARGET GENE. LOC352739 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC352739, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC352739 BINDING SITE, designated SEQ ID:8832, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2619] Another function of GAM31 is therefore inhibition of LOC352739 (Accession XP_305938.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC352739.

[2620] LOC51619 (Accession NP_057067.1) is another GAM31 target gene, herein designated TARGET GENE. LOC51619 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51619, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51619 BINDING SITE, designated SEQ ID:20004, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2621] Another function of GAM31 is therefore inhibition of LOC51619 (Accession NP_057067.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC51619.

[2622] LOC90670 (Accession XP_033352.1) is another GAM31 target gene, herein designated TARGET GENE. LOC90670 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90670, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90670 BINDING SITE, designated SEQ ID:9139, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2623] Another function of GAM31 is therefore inhibition of LOC90670 (Accession XP_033352.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90670.

[2624] LOC91526 (Accession NP_710181.1) is another GAM31 target gene, herein designated TARGET GENE. LOC91526 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91526, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of LOC91526 BINDING SITE, designated SEQ ID:16059, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2625] Another function of GAM31 is therefore inhibition of LOC91526 (Accession NP_710181.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91526.

[2626] LOC96597 (Accession XP_039922.1) is another GAM31 target gene, herein designated TARGET GENE. LOC96597 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC96597, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:19996, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2627] Another function of GAM31 is therefore inhibition of LOC96597 (Accession XP_039922.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC96597.

[2628] Lipin 2 (LPIN2, Accession NP_055461.1) is another GAM31 target gene, herein designated TARGET GENE. LPIN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LPIN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LPIN2 BINDING SITE, designated SEQ ID:8573, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2629] Another function of GAM31 is therefore inhibition of Lipin 2 (LPIN2, Accession NP_055461.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN2.

[2630] LRRN4 (Accession NP_002310.2) is another GAM31 target gene, herein designated TARGET GENE. LRRN4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LRRN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LRRN4 BINDING SITE, designated SEQ ID:8168, to the nucleotide se-

quence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2631] Another function of GAM31 is therefore inhibition of LRRN4 (Accession NP_002310.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRN4.

[2632] Mitogen-activated protein kinase kinase kinase 2 (MAP3K2, Accession NP_006600.2) is another GAM31 target gene, herein designated TARGET GENE. MAP3K2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAP3K2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K2 BINDING SITE, designated SEQ ID:17136, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2633] Another function of GAM31 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 2 (MAP3K2, Accession NP_006600.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K2.

[2634] MCLC (Accession NP_055942.1) is another GAM31 target

gene, herein designated TARGET GENE. MCLC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCLC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCLC BINDING SITE, designated SEQ ID:17231, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2635] Another function of GAM31 is therefore inhibition of MCLC (Accession NP_055942.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCLC.

[2636] Mads box transcription enhancer factor 2, polypeptide b (myocyte enhancer factor 2b) (MEF2B, Accession NP_005910.1) is another GAM31 target gene, herein designated TARGET GENE. MEF2B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MEF2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEF2B BINDING SITE, designated SEQ ID:16083, to the nucleotide sequence of GAM31 RNA,

herein designated GAM RNA, also designated SEQ ID:250.

[2637] Another function of GAM31 is therefore inhibition of Mads box transcription enhancer factor 2, polypeptide b (myocyte enhancer factor 2b) (MEF2B, Accession NP_005910.1), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2B.

[2638] The function of MEF2B has been established by previous studies. See MEF2A (OMIM Ref. No. 600660). The process of differentiation from mesodermal precursor cells to myoblasts has led to the discovery of a variety of tissue-specific factors that regulate muscle gene expression (e.g., 159970). Pollock and Treisman (1991) cloned a cDNA for MEF2B which they designated as a member of the RSRF (related to serum response factor) family. They described its DNA binding properties and discussed its potential role as a regulator of muscle- specific genes. Yu et al. (1992) also obtained MEF2B cDNAs by screening an expression library of primary human skeletal myocytes from vastus lateralis with a DNA probe containing the MEF2 binding sequence. The predicted MEF2B protein includes the conserved MADS and MEF2 domains but other-

wise is distinct from MEF2A. Hobson et al. (1995) mapped the MEF2B gene using somatic cell hybrid panel DNAs including deletion or derivative chromosome cell lines and regionalized it to 19p12 by identifying cosmids in a chromosome 19 contig, members of which had previously been mapped to this band and close to the beginning of 19p13.1. T cell receptor (TCR)- induced apoptosis of thymocytes is mediated by calcium- dependent expression of the steroid receptors Nur77 (see OMIM Ref. No. 139139) and Nor1 (see OMIM Ref. No. 600542). MEF2 had been implicated as a calcium- dependent transcription factor for Nur77 expression. Youn et al. (1999) demonstrated that Cabin1 (OMIM Ref. No. 604251), a calcineurin (see OMIM Ref. No. 114105) inhibitor, regulated MEF2. MEF2 was normally sequestered by Cabin1 in a transcriptionally inactive state. TCR engagement led to an increase in intracellular calcium concentration and the dissociation of MEF2 from Cabin1, as a result of competitive binding of activated calmodulin (OMIM Ref. No. 114180) to Cabin1. The interplay between Cabin1, MEF2, and calmodulin defines a distinct signaling pathway from the TCR to the Nur77 promoter during T cell apoptosis.

[2639]

[2640] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2641] Pollock, R.; Treisman, R. : Human SRF- related proteins: DNA- binding properties and potential regulatory targets. Genes Dev. 5: 2327- 2341, 1991. ; and

[2642] Youn, H.- D.; Sun, L.; Prywes, R.; Liu, J. O. : Apoptosis of T cells mediated by Ca(2+)- induced release of the transcription factor MEF2. Science 286: 790- 793, 1999.

[2643] Further studies establishing the function and utilities of MEF2B are found in John Hopkins OMIM database record ID 600661, and in cited publications listed in Table 5, which are hereby incorporated by reference.MEGF11 (Accession NP_115821.1) is another GAM31 target gene, herein designated TARGET GENE. MEGF11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEGF11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEGF11 BINDING SITE, designated SEQ ID:10033, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2644] Another function of GAM31 is therefore inhibition of MEGF11 (Accession NP_115821.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF11.

[2645] MGC24665 (Accession NP_689521.1) is another GAM31 target gene, herein designated TARGET GENE. MGC24665 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC24665, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC24665 BINDING SITE, designated SEQ ID:755, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2646] Another function of GAM31 is therefore inhibition of MGC24665 (Accession NP_689521.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC24665.

[2647] MGC2941 (Accession NP_077273.1) is another GAM31 target gene, herein designated TARGET GENE. MGC2941 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2941, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2941 BINDING SITE, designated SEQ ID:789, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2648] Another function of GAM31 is therefore inhibition of MGC2941 (Accession NP_077273.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2941.

[2649] MGC33926 (Accession NP_689603.1) is another GAM31 target gene, herein designated TARGET GENE. MGC33926 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33926, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33926 BINDING SITE, designated SEQ ID:18620, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2650] Another function of GAM31 is therefore inhibition of MGC33926 (Accession NP_689603.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC33926.

[2651] MGC35468 (Accession NP_694976.1) is another GAM31 target gene, herein designated TARGET GENE. MGC35468 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC35468, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35468 BINDING SITE, designated SEQ ID:19738, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2652] Another function of GAM31 is therefore inhibition of MGC35468 (Accession NP_694976.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35468.

[2653] MGC4504 (Accession NP_077016.1) is another GAM31 target gene, herein designated TARGET GENE. MGC4504 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4504, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC4504 BINDING SITE, designated SEQ ID:8302, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2654] Another function of GAM31 is therefore inhibition of MGC4504 (Accession NP_077016.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4504.

[2655] MIDORI (Accession NP_065829.1) is another GAM31 target gene, herein designated TARGET GENE. MIDORI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MIDORI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:1428, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2656] Another function of GAM31 is therefore inhibition of MIDORI (Accession NP_065829.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIDORI.

[2657] Paired basic amino acid cleaving system 4 (PACE4, Acces-

sion NP_612196.1) is another GAM31 target gene, herein designated TARGET GENE. PACE4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PACE4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:3372, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2658] Another function of GAM31 is therefore inhibition of Paired basic amino acid cleaving system 4 (PACE4, Accession NP_612196.1), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4.

[2659] The function of PACE4 has been established by previous studies. Using PCR methods, Kiefer et al. (1991) identified a second human subtilisin- like protease gene on chromosome 15. PCR primers were designed to be specific for the subfamily of eukaryotic subtilisin- like proteases with specificity for paired basic amino acid residue processing

motifs. The gene encoding this protease, designated PACE4, also encoded a smaller subtilisin- related polypeptide derived by alternative mRNA splicing. As with the product of the PACE gene (OMIM Ref. No. 136950), the tissue distribution of PACE4 was widespread, with comparatively higher levels in the liver. By in situ hybridization using isolated cosmid clones, Kiefer et al. (1991) mapped the PACE4 gene to chromosome 15 in close proximity to the PACE gene at 15q25- q26. Double labeling in situ hybridization suggested that the 2 genes are within 5 megabases of each other. Mbikay et al. (1995) mapped the gene for PACE4 (Pcsk6) to mouse chromosome 7 by RFLP analysis of a DNA panel from an interspecific backcross. It was located at a distance of 13 cM from the Pcsk3 locus, which specifies furin (OMIM Ref. No. 136950), another member of this family of enzymes previously mapped to mouse chromosome 7. This is in concordance with the known close proximity of these 2 loci in the homologous region on human 15q25- qter. Pcsk3 and Pcsk6 map to a region of mouse chromosome 7 that has been associated cytogenetically with postnatal lethality in maternal disomy, suggesting that these genes may be imprinted.

[2660]

[2661] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2662] Kiefer, M. C.; Tucker, J. E.; Joh, R.; Landsberg, K. E.; Saltman, D.; Barr, P. J. : Identification of a second human subtilisin- like protease gene in the fes/fps region of chromosome 15. DNA Cell Biol. 10: 757- 769, 1991. ; and

[2663] Mbikay, M.; Seidah, N. G.; Chretien, M.; Simpson, E. M. : Chromosomal assignment of the genes for proprotein convertases PC4, PC5, and PACE 4 in mouse and human. Genomics 26: 123- 129, 19.

[2664] Further studies establishing the function and utilities of PACE4 are found in John Hopkins OMIM database record ID 167405, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired basic amino acid cleaving system 4 (PACE4, Accession NP_612197.1) is another GAM31 target gene, herein designated TARGET GENE. PACE4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PACE4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:3372, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2665] Another function of GAM31 is therefore inhibition of Paired basic amino acid cleaving system 4 (PACE4, Accession NP_612197.1), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4.

[2666] The function of PACE4 has been established by previous studies. Using PCR methods, Kiefer et al. (1991) identified a second human subtilisin- like protease gene on chromosome 15. PCR primers were designed to be specific for the subfamily of eukaryotic subtilisin- like proteases with specificity for paired basic amino acid residue processing motifs. The gene encoding this protease, designated PACE4, also encoded a smaller subtilisin- related polypeptide derived by alternative mRNA splicing. As with the product of the PACE gene (OMIM Ref. No. 136950), the tissue distribution of PACE4 was widespread, with comparatively higher levels in the liver. By in situ hybridization

using isolated cosmid clones, Kiefer et al. (1991) mapped the PACE4 gene to chromosome 15 in close proximity to the PACE gene at 15q25- q26. Double labeling in situ hybridization suggested that the 2 genes are within 5 megabases of each other. Mbikay et al. (1995) mapped the gene for PACE4 (Pcsk6) to mouse chromosome 7 by RFLP analysis of a DNA panel from an interspecific backcross. It was located at a distance of 13 cM from the Pcsk3 locus, which specifies furin (OMIM Ref. No. 136950), another member of this family of enzymes previously mapped to mouse chromosome 7. This is in concordance with the known close proximity of these 2 loci in the homologous region on human 15q25- qter. Pcsk3 and Pcsk6 map to a region of mouse chromosome 7 that has been associated cytogenetically with postnatal lethality in maternal disomy, suggesting that these genes may be imprinted.

[2667]

[2668] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2669] Kiefer, M. C.; Tucker, J. E.; Joh, R.; Landsberg, K. E.; Saltman, D.; Barr, P. J. : Identification of a second human sub-

tilisin- like protease gene in the fes/fps region of chromosome 15. DNA Cell Biol. 10: 757- 769, 1991. ; and

[2670] Mbikay, M.; Seidah, N. G.; Chretien, M.; Simpson, E. M. : Chromosomal assignment of the genes for proprotein convertases PC4, PC5, and PACE 4 in mouse and human. Genomics 26: 123- 129, 19.

[2671] Further studies establishing the function and utilities of PACE4 are found in John Hopkins OMIM database record ID 167405, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1) is another GAM31 target gene, herein designated TARGET GENE. PDE4B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4B BINDING SITE, designated SEQ ID:17193, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2672] Another function of GAM31 is therefore inhibition of

Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1), a gene which may be involved in mediating central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti- inflammatory agents. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4B.

[2673] The function of PDE4B has been established by previous studies. Huston et al. (1997) cloned a novel human (plus its cognate rat) PDE4B splice variant and compared its activities to the 2 other splice variants from this locus. Alternative splicing of mRNA generated from both the human and rat PDE4B genes produced long and short splice variants that had unique N- terminal regions. It was suggested that these alternatively spliced regions determined changes in the maximal catalytic activity of the isoforms, their susceptibility to inhibition by rolipram, and mode of interaction with particulate fractions. Milatovich et al. (1994) mapped the PDE4B gene to human 1p31 by a combination of Southern analysis of somatic cell hybrid lines and fluorescence in situ hybridization (FISH); they assigned the mouse homolog to chromosome 4 by Southern

analysis of recombinant inbred (RI) mouse strains. Through the use of somatic cell hybrids segregating either human or rat chromosomes, Szpirer et al. (1995) mapped the PDE4B gene to human chromosome 1 and rat chromosome 5.

[2674]

[2678] Further studies establishing the function and utilities of PDE4B are found in John Hopkins OMIM database record ID 600127, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paternally ex-

pressed 10 (PEG10, Accession NP_055883.1) is another GAM31 target gene, herein designated TARGET GENE. PEG10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:1451, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2679] Another function of GAM31 is therefore inhibition of Paternally expressed 10 (PEG10, Accession NP_055883.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10.

[2680] Phospholipase c, gamma 1 (formerly subtype 148) (PLCG1, Accession NP_002651.1) is another GAM31 target gene, herein designated TARGET GENE. PLCG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLCG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLCG1 BINDING SITE,

designated SEQ ID:760, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2681] Another function of GAM31 is therefore inhibition of Phospholipase c, gamma 1 (formerly subtype 148) (PLCG1, Accession NP_002651.1), a gene which is a major substrate for heparin- binding growth factor 1 - activated tyrosine kinase. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCG1.

[2682] The function of PLCG1 has been established by previous studies. The binding of various agonists to their specific cell- surface receptors rapidly induces formation of 2 second- messenger molecules derived from phosphatidylinositol 4,5- bisphosphate, namely, diacylglycerol and inositol 1,4,5- triphosphate. The production of these second- messenger molecules is mediated by activated phosphatidyl inositol- specific phospholipase C (PLC) enzymes. There are several immunologically distinct enzymes with phosphatidylinositol- specific PLC activities. Stahl et al. (1988) purified, cloned, and expressed 1 of these PLC subtypes, which they referred to as PLC- 148. They found that PLC- 148 mRNA is expressed in most cell

types and is present as a single- copy gene. Structural homology with SRC (OMIM Ref. No. 190090) was noted. Bristol et al. (1988) found by in situ hybridization that the PLCG1 gene is located on 20q12- q13.1. Southern blot analysis of DNA from human- mouse hybrid cells supported the assignment to chromosome 20. The location of both SRC and PLC148 on chromosome 20 is of interest. The region is often involved in interstitial deletions and breakpoints in myeloid malignancy. Using the highly polymorphic (dC- dA)n/(dG- dT)n dinucleotide repeat at the PLC1 locus, Rothschild et al. (1992) demonstrated close linkage to several chromosome 20 markers including adenosine deaminase (ADA; 102700); maximum lod = 57.24 at theta = 0.05. In addition, the PLC1 gene showed linkage to the MODY locus (OMIM Ref. No. 125850); lod score = 4.57 at theta = 0.089. Nelson et al. (1992) mapped the Plcg1 gene to mouse chromosome 2. Chuang et al. (2001) demonstrated that bradykinin- or NGF- mediated potentiation of thermal sensitivity in vivo requires expression of VR1 (OMIM Ref. No. 602076), a heat- activated ion channel on sensory neurons. Diminution of plasma membrane phosphatidylinositol- 4,5,bisphosphate levels through antibody sequestration or PLC- mediated

hydrolysis mimics the potentiating effects of bradykinin or NGF at the cellular level. Moreover, recruitment of PLC-gamma to TRK- alpha (OMIM Ref. No. 191315) is essential for NGF- mediated potentiation of channel activity, and biochemical studies suggested that VR1 associates with this complex. Chuang et al. (2001) concluded that their studies delineate a biochemical mechanism through which bradykinin and NGF produce hypersensitivity and might explain how the activation of PLC signaling systems regulates other members of the TRP channel family. Ye et al. (2002) demonstrated that PLCG1 acts as a guanine nucleotide exchange factor for PIKE (OMIM Ref. No. 605476). PIKE is a nuclear GTPase that activates nuclear phosphatidylinositol- 3- hydroxykinase (PI(3)K) activity, and mediates the physiologic activation by nerve growth factor (see OMIM Ref. No. 162020) of nuclear PI(3)K activity. This enzymatic activity accounts for the mitogenic properties of PLCG1.

[2683]

[2684] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2685] Stahl, M. L.; Ferenz, C. R.; Kelleher, K. L.; Kriz, R. W.;

Knopf, J. L. : Sequence similarity of phospholipase C with the non- catalytic region of src. Nature 332: 269- 272, 1988. ; and

[2686] Ye, K.; Aghdasi, B.; Luo, H. R.; Moriarity, J. L.; Wu, F. Y.; Hong, J. J.; Hurt, K. J.; Bae, S. S.; Suh, P.- G.; Snyder, S. H. : Phospholipase C- gamma- 1 is a physiological guanine nucleo.

[2687] Further studies establishing the function and utilities of PLCG1 are found in John Hopkins OMIM database record ID 172420, and in cited publications listed in Table 5, which are hereby incorporated by refer- ence.Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, ehlers-danlos syndrome type vi) (PLOD, Accession NP_000293.1) is another GAM31 target gene, herein designated TARGET GENE. PLOD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLOD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com- plementarity of the nucleotide sequences of PLOD BIND- ING SITE, designated SEQ ID:15113, to the nucleotide se- quence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2688] Another function of GAM31 is therefore inhibition of Pro-collagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, ehlers-danlos syndrome type vi) (PLOD, Accession NP_000293.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLOD.

[2689] RODH (Accession NP_003716.2) is another GAM31 target gene, herein designated TARGET GENE. RODH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RODH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RODH BINDING SITE, designated SEQ ID:14449, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2690] Another function of GAM31 is therefore inhibition of RODH (Accession NP_003716.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RODH.

[2691] Spastic ataxia of charlevoix-saguenay (sacsin) (SACS, Accession NP_055178.1) is another GAM31 target gene, herein designated TARGET GENE. SACS BINDING SITE is a

target binding site found in the 3` untranslated region of mRNA encoded by SACS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SACS BINDING SITE, designated SEQ ID:14450, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2692] Another function of GAM31 is therefore inhibition of Spastic ataxia of charlevoix-saguenay (sacsin) (SACS, Accession NP_055178.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SACS.

[2693] Sar1a gene homolog 1 (s. cerevisiae) (SARA1, Accession NP_064535.1) is another GAM31 target gene, herein designated TARGET GENE. SARA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SARA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SARA1 BINDING SITE, designated SEQ ID:9126, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2694] Another function of GAM31 is therefore inhibition of Sar1a gene homolog 1 (s. cerevisiae) (SARA1, Accession NP_064535.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARA1.

[2695] Splicing factor proline/glutamine rich (polypyrimidine tract binding protein associated) (SFPQ, Accession NP_005057.1) is another GAM31 target gene, herein designated TARGET GENE. SFPQ BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFPQ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFPQ BINDING SITE, designated SEQ ID:16010, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2696] Another function of GAM31 is therefore inhibition of Splicing factor proline/glutamine rich (polypyrimidine tract binding protein associated) (SFPQ, Accession NP_005057.1), a gene which binds intronic polypyrimidine tracts. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFPQ.

[2697] The function of SFPQ has been established by previous studies. Patton et al. (1993) identified a 100- kD protein that copurified and associated with polypyrimidine tract-binding protein (PTB; 600693). By microsequence analysis and PCR, followed by screening a fetal brain cDNA library, Patton et al. (1993) isolated cDNAs encoding alternatively spliced isoforms of this protein, which they called PSF (PTB- associated splicing factor). The deduced 669- and 707- amino acid PSF isoforms contain 2 consensus RNA-binding domains and an unusual N terminus rich in proline and glutamine residues. PSF is highly basic and has a predicted molecular mass of 76 kD, which is much lower than the experimentally determined molecular mass of 100 kD. Northern blot analysis detected PSF transcripts of 2.5 and 3.0 kb, consistent with the alternative splicing. The authors found that the RNA- binding properties of PSF are identical to those of PTB and that both proteins, together and independently, bind the polypyrimidine tract of mammalian introns. Biochemical complementation, antibody inhibition, and immunodepletion experiments demonstrated that PSF is an essential pre- mRNA splicing factor required early in spliceosome formation. Bacterially synthesized PSF was able to complement immunodepleted

extracts and restore splicing activity. Despite its association with PSF, complementary experiments with antibodies against PTB did not suggest an essential role for PTB in pre- mRNA splicing. Clark et al. (1997) identified cases of papillary renal cell carcinoma in which the splicing factor gene PSF was partnered with the TFE3 gene as a result of a translocation, t(X;1)(p11.2;p34).

[2698]

[2699] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2700] Patton, J. G.; Porro, E. B.; Galceran, J.; Tempst, P.; Nadal-Ginard, B. : Cloning and characterization of PSF, a novel pre- mRNA splicing factor. Genes Dev. 7: 393- 406, 1993. ; and

[2701] Clark, J.; Lu, Y.- J.; Sidhar, S. K.; Parker, C.; Gill, S.; Smedley, D.; Hamoudi, R.; Linehan, W. M.; Shipley, J.; Cooper, C. S. : Fusion of splicing factor genes PSF and NonO (p54-nrb) to.

[2702] Further studies establishing the function and utilities of SFPQ are found in John Hopkins OMIM database record ID 605199, and in cited publications listed in Table 5, which are hereby incorporated by reference.Siat7c (Accession

NP_694541.1) is another GAM31 target gene, herein designated TARGET GENE. Siat7c BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Siat7c, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Siat7c BINDING SITE, designated SEQ ID:11487, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2703] Another function of GAM31 is therefore inhibition of Siat7c (Accession NP_694541.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Siat7c.

[2704] Solute carrier family 19, member 3 (SLC19A3, Accession NP_079519.1) is another GAM31 target gene, herein designated TARGET GENE. SLC19A3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC19A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC19A3 BINDING SITE, designated SEQ ID:16645, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated

SEQ ID:250.

[2705] Another function of GAM31 is therefore inhibition of Solute carrier family 19, member 3 (SLC19A3, Accession NP_079519.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A3.

[2706] Serine protease inhibitor-like, with kunitz and wap domains 1 (eppin) (SPINLW1, Accession NP_852479.1) is another GAM31 target gene, herein designated TARGET GENE. SPINLW1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SPINLW1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPINLW1 BINDING SITE, designated SEQ ID:10499, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2707] Another function of GAM31 is therefore inhibition of Serine protease inhibitor-like, with kunitz and wap domains 1 (eppin) (SPINLW1, Accession NP_852479.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with SPINLW1.

[2708] Serine protease inhibitor-like, with kunitz and wap domains 1 (eppin) (SPINLW1, Accession NP_065131.1) is another GAM31 target gene, herein designated TARGET GENE. SPINLW1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SPINLW1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPINLW1 BINDING SITE, designated SEQ ID:10499, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2709] Another function of GAM31 is therefore inhibition of Serine protease inhibitor-like, with kunitz and wap domains 1 (eppin) (SPINLW1, Accession NP_065131.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPINLW1.

[2710] Synovial sarcoma, x breakpoint 2 interacting protein (SSX2IP, Accession NP_054740.1) is another GAM31 target gene, herein designated TARGET GENE. SSX2IP BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by SSX2IP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSX2IP BINDING SITE, designated SEQ ID:5546, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2711] Another function of GAM31 is therefore inhibition of Synovial sarcoma, x breakpoint 2 interacting protein (SSX2IP, Accession NP_054740.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSX2IP.

[2712] Thyroid hormone receptor, alpha (erythroblastic leukemia viral (v-erb-a) oncogene homolog, avian) (THRA, Accession NP_003241.2) is another GAM31 target gene, herein designated TARGET GENE. THRA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by THRA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THRA BINDING SITE, designated SEQ ID:5656, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2713] Another function of GAM31 is therefore inhibition of Thyroid hormone receptor, alpha (erythroblastic leukemia viral (v-erb-a) oncogene homolog, avian) (THRA, Accession NP_003241.2), a gene which is a high affinity receptor for thyroid hormone and therefore may be associated with Nonfunctioning pituitary adenoma. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of Nonfunctioning pituitary adenoma, and of other diseases and clinical conditions associated with THRA.

[2714] The function of THRA has been established by previous studies. Debuire et al. (1984) found that ERBA, which potentiates ERBB (OMIM Ref. No. 131550), has an amino acid sequence different from that of other known oncogene products and related to those of the carbonic anhydrases. ERBA potentiates ERBB by blocking differentiation of erythroblasts at an immature stage. Carbonic anhydrases participate in the transport of carbon dioxide in erythrocytes. Sap et al. (1986) and Weinberger et al. (1986) showed that the ERBA protein is a high- affinity receptor for thyroid hormone. The cDNA sequence indicates a relationship to steroid- hormone receptors, and binding studies indicate that it is a receptor for thyroid hormones. It is located in the nucleus, where it binds to DNA and ac-

tivates transcription. McCabe et al. (1999) hypothesized that aberrant THRA expression in nonfunctioning pituitary tumors may reflect mutations in the receptor coding and regulatory sequences. They screened THRA mRNA and THRB response elements and ligand- binding domains for sequence anomalies. Screening THRA mRNA from 23 tumors by RNase mismatch and sequencing candidate fragments identified 1 silent and 3 missense mutations, 2 in the common THRA region (190120.0001, 190120.0002) and 1 that was specific for the alpha- 2 isoform (190120.0003). No THRB response element differences were detected in 14 nonfunctioning tumors, and no THRB ligand- binding domain differences were detected in 23 nonfunctioning tumors. The authors suggested that the novel thyroid receptor mutations may be of functional significance in terms of thyroid receptor action, and further definition of their functional properties may provide insight into the role of thyroid receptors in growth control in pituitary cells.

[2715] Animal model experiments lend further support to the function of THRA. To evaluate the respective contributions of THRA and THRB in the regulation of CYP7A (OMIM Ref. No. 118455), the rate- limiting enzyme in the synthesis of

bile acids, Gullberg et al. (2000) studied the responses to 2% dietary cholesterol and T3 in THRA and THRB knockout mice under hypo- and hyperthyroid conditions. Their experiments showed that the normal stimulation in CYP7A activity and mRNA level by T3 is lost in THRB - /-, but not in THRA - /-, mice, identifying THRB as the mediator of T3 action on CYP7A and, consequently, as a major regulator of cholesterol metabolism in vivo. Somewhat unexpectedly, T3- deficient THRB - /- mice showed an augmented CYP7A response after challenge with dietary cholesterol, and these animals did not develop hypercholesterolemia to the extent that wildtype controls did. The authors concluded that the latter results lend strong support to the concept that THRs may exert regulatory effects in vivo independent of T3.

[2716] It is appreciated that the abovementioned animal model for THRA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2717] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2718] Weinberger, C.; Thompson, C. C.; Ong, E. S.; Lebo, R.;

Gruol, D. J.; Evans, R. M. : The c- erb- A gene encodes a thyroid hormone receptor. Nature 324: 641- 646, 1986. ; and

[2719] Gullberg, H.; Rudling, M.; Forrest, D.; Angelin, B.; Vennstrom, B. : Thyroid hormone receptor beta- deficient mice show complete loss of the normal cholesterol 7- alpha- hydroxylase (CYP7A).

[2720] Further studies establishing the function and utilities of THRA are found in John Hopkins OMIM database record ID 190120, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tyrosine kinase, non-receptor, 1 (TNK1, Accession NP_003976.1) is another GAM31 target gene, herein designated TARGET GENE. TNK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNK1 BINDING SITE, designated SEQ ID:16242, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2721] Another function of GAM31 is therefore inhibition of Tyrosine kinase, non-receptor, 1 (TNK1, Accession

NP_003976.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNK1.

[2722] Tripartite motif-containing 8 (TRIM8, Accession NP_112174.1) is another GAM31 target gene, herein designated TARGET GENE. TRIM8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIM8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM8 BINDING SITE, designated SEQ ID:7224, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2723] Another function of GAM31 is therefore inhibition of Tripartite motif-containing 8 (TRIM8, Accession NP_112174.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM8.

[2724] Thioredoxin-like, 32kda (TXNL, Accession NP_004777.1) is another GAM31 target gene, herein designated TARGET GENE. TXNL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TXNL, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TXNL BINDING SITE, designated SEQ ID:18077, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2725] Another function of GAM31 is therefore inhibition of Thioredoxin-like, 32kda (TXNL, Accession NP_004777.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXNL.

[2726] VTS58635 (Accession NP_201572.1) is another GAM31 target gene, herein designated TARGET GENE. VTS58635 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VTS58635, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VTS58635 BINDING SITE, designated SEQ ID:11083, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2727] Another function of GAM31 is therefore inhibition of VTS58635 (Accession NP_201572.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with VTS58635.

[2728] Zinc finger, dhhc domain containing 6 (ZDHHC6, Accession NP_071939.1) is another GAM31 target gene, herein designated TARGET GENE. ZDHHC6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZDHHC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZDHHC6 BINDING SITE, designated SEQ ID:11341, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2729] Another function of GAM31 is therefore inhibition of Zinc finger, dhhc domain containing 6 (ZDHHC6, Accession NP_071939.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC6.

[2730] ZF (Accession NP_067035.1) is another GAM31 target gene, herein designated TARGET GENE. ZF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZF BINDING SITE, designated SEQ ID:16486, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2731] Another function of GAM31 is therefore inhibition of ZF (Accession NP_067035.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF.

[2732] Zinc finger protein 238 (ZNF238, Accession NP_006343.2) is another GAM31 target gene, herein designated TARGET GENE. ZNF238 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF238, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF238 BINDING SITE, designated SEQ ID:5764, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2733] Another function of GAM31 is therefore inhibition of Zinc finger protein 238 (ZNF238, Accession NP_006343.2) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with ZNF238.

[2734] Zinc finger protein 259 (ZNF259, Accession NP_003895.1) is another GAM31 target gene, herein designated TARGET GENE. ZNF259 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF259 BINDING SITE, designated SEQ ID:13366, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2735] Another function of GAM31 is therefore inhibition of Zinc finger protein 259 (ZNF259, Accession NP_003895.1) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF259.

[2736] Zinc finger protein 294 (ZNF294, Accession XP_047829.3) is another GAM31 target gene, herein designated TARGET GENE. ZNF294 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of ZNF294 BINDING SITE, designated SEQ ID:13175, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2737] Another function of GAM31 is therefore inhibition of Zinc finger protein 294 (ZNF294, Accession XP_047829.3) . Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF294.

[2738] Zinc finger protein 294 (ZNF294, Accession NP_056380.1) is another GAM31 target gene, herein designated TARGET GENE. ZNF294 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF294 BINDING SITE, designated SEQ ID:13175, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2739] Another function of GAM31 is therefore inhibition of Zinc finger protein 294 (ZNF294, Accession NP_056380.1) . Accordingly, utilities of GAM31 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with ZNF294.

[2740] Zinc finger protein 36 (kox 18) (ZNF36, Accession XP_168302.1) is another GAM31 target gene, herein designated TARGET GENE. ZNF36 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF36, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:13144, to the nucleotide sequence of GAM31 RNA, herein designated GAM RNA, also designated SEQ ID:250.

[2741] Another function of GAM31 is therefore inhibition of Zinc finger protein 36 (kox 18) (ZNF36, Accession XP_168302.1), a gene which may be involved in transcriptional regulation. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36.

[2742] The function of ZNF36 has been established by previous studies. By screening a human insulinoma cDNA library with a degenerate oligonucleotide corresponding to the H/C linker sequence, Tommerup et al. (1993) isolated cDNAs potentially encoding zinc finger proteins. Tommerup

and Vissing (1995) performed sequence analysis on a number of these cDNAs and identified several novel zinc finger protein genes, including ZNF36, which they called ZNF139. The ZNF139 cDNA predicts a protein belonging to the Kruppel family of zinc finger proteins. By isotopic in situ hybridization, Rousseau- Merck et al. (1995) mapped the ZNF36 gene, which they called KOX18, to 7q21- q22. From pulsed field gel electrophoresis studies, they showed that KOX18 is within less than 250 kb of KOX25 (ZNF38; 601261). Rousseau- Merck et al. (1995) tabulated 18 different KOX genes that had been located in pairs within 9 DNA fragments of 200 to 580 kb on 7 different chromosomes. By FISH, Tommerup and Vissing (1995) mapped the ZNF36 gene to 7q21.3- q22.1.

[2743]

[2744] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2745] Tommerup, N.; Vissing, H. : Isolation and fine mapping of 16 novel human zinc finger- encoding cDNAs identify putative candidate genes for developmental and malignant disorders. Genomics 27: 259- 264, 1995. ; and

[2746] Rousseau- Merck, M.- F.; Duro, D.; Berger, R.; Thiesen, H.

J. : Chromosomal localization of two KOX zinc finger genes on chromosome bands 7q21- q22. Ann. Genet. 38: 81- 84, 1995.

[2747] Further studies establishing the function and utilities of ZNF36 are found in John Hopkins OMIM database record ID 601260, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[2748] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 32 (GAM32), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[2749] GAM32 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM32 was detected is described hereinabove with reference to Figs. 8-15.

[2750] GAM32 gene, herein designated GAM GENE, and GAM32 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2751] GAM32 gene encodes a GAM32 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM32 precursor

RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM32 precursor RNA is designated SEQ ID:187, and is provided hereinbelow with reference to the sequence listing part.

[2752] GAM32 precursor RNA folds onto itself, forming GAM32 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2753] GAM32 precursor RNA folds onto itself, forming GAM32 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2754] Nucleotide sequence of GAM32 precursor RNA, designated SEQ-ID: 187, and a schematic representation of a predicted secondary folding of GAM32 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2755] An enzyme complex designated DICER COMPLEX, `dices` the GAM32 folded precursor RNA into GAM32 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM32 RNA is designated SEQ ID:384, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2756] GAM32 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM32 target RNA, herein designated GAM TARGET RNA. GAM32 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[2757] GAM32 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM32 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM32 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM32 RNA may have a different number of target binding sites in untranslated regions of a GAM32 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2758] The complementary binding of GAM32 RNA, herein designated GAM RNA, to target binding sites on GAM32 target RNA, herein designated GAM TARGET RNA, such as BIND-

ING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM32 target RNA into GAM32 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2759] It is appreciated that GAM32 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM32 target genes. The mRNA of each one of this plurality of GAM32 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM32 RNA, herein designated GAM RNA, and which when bound by GAM32 RNA causes inhibition of translation of respective one or more GAM32 target proteins.

[2760] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM32 gene, herein designated GAM GENE, on one or more GAM32 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[2761] It is appreciated that specific functions and accordingly utilities of GAM32 correlate with, and may be deduced from, the identity of the target genes which GAM32 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2762]

[2763]

[2764] Cullin 3 (CUL3, Accession NM_003590.1) is a GAM32 target gene, herein designated TARGET GENE. CUL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CUL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:7209, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also

designated SEQ ID:384.

[2765] A function of GAM32 is therefore inhibition of Cullin 3 (CUL3, Accession NM_003590.1), a gene which may target other proteins for ubiquitin- dependent proteolysis. Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3.

[2766] The function of CUL3 has been established by previous studies. Kipreos et al. (1996) identified a conserved gene family, designated cullins, with at least 5 members in nematodes, 6 in humans, and 3 in S. cerevisiae. See CUL1 (OMIM Ref. No. 603134). Human CUL3 is an ortholog of nematode cul3. Michel and Xiong (1998) identified human CUL3 cDNAs and reported that the predicted protein is 768 amino acids long. Ishikawa et al. (1998) isolated a CUL3 cDNA, KIAA0617, as 1 of 100 brain cDNAs encoding large proteins. Using RT- PCR, they found that CUL3 is expressed in several tissues. Du et al. (1998) identified CUL3 as a gene whose expression in human fibroblasts is induced by phorbol 12- myristate 13- acetate (PMA) and suppressed by salicylate. They reported that the sequences of the human and C. elegans cul3 proteins share 46% identity. Northern blot analysis revealed that CUL3 is

expressed as major 2.8- and minor 4.3- kb transcripts in various human tissues, with the highest levels in skeletal muscle and heart.

[2767]

[2768] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2769] Du, M.; Sansores- Garcia, L.; Zu, Z.; Wu, K. K. : Cloning and expression analysis of a novel salicylate suppressible gene, Hs- CUL- 3, a member of cullin/Cdc53 family. J. Biol. Chem. 273: 24289- 24292, 1998. ; and

[2770] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete seque.

[2771] Further studies establishing the function and utilities of CUL3 are found in John Hopkins OMIM database record ID 603136, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0237 (Accession NM_014747.1) is another GAM32 target gene, herein designated TARGET GENE. KIAA0237 BINDING SITE is a target binding site found in the 3` untranslated re- gion of mRNA encoded by KIAA0237, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16243, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2772] Another function of GAM32 is therefore inhibition of KIAA0237 (Accession NM_014747.1) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237.

[2773] KIAA0514 (Accession NM_014696.1) is another GAM32 target gene, herein designated TARGET GENE. KIAA0514 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:11389, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2774] Another function of GAM32 is therefore inhibition of KIAA0514 (Accession NM_014696.1) . Accordingly, utili-

ties of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514.

[2775] LOC149734 (Accession) is another GAM32 target gene, herein designated TARGET GENE. LOC149734 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149734, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149734 BINDING SITE, designated SEQ ID:1549, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2776] Another function of GAM32 is therefore inhibition of LOC149734 (Accession) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149734.

[2777] LOC151959 (Accession XM_098144.1) is another GAM32 target gene, herein designated TARGET GENE. LOC151959 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151959, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC151959 BINDING SITE, designated SEQ ID:11716, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2778] Another function of GAM32 is therefore inhibition of LOC151959 (Accession XM_098144.1) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151959.

[2779] LOC90362 (Accession) is another GAM32 target gene, herein designated TARGET GENE. LOC90362 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90362, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90362 BINDING SITE, designated SEQ ID:5001, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2780] Another function of GAM32 is therefore inhibition of LOC90362 (Accession) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90362.

[2781] Protocadherin 11 y-linked (PCDH11Y, Accession NM_032972.1) is another GAM32 target gene, herein designated TARGET GENE. PCDH11Y BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDH11Y, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH11Y BINDING SITE, designated SEQ ID:14519, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2782] Another function of GAM32 is therefore inhibition of Protocadherin 11 y-linked (PCDH11Y, Accession NM_032972.1) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11Y.

[2783] Protocadherin beta 3 (PCDHB3, Accession NM_018937.2) is another GAM32 target gene, herein designated TARGET GENE. PCDHB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of PCDHB3 BINDING SITE, designated SEQ ID:4570, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2784] Another function of GAM32 is therefore inhibition of Protocadherin beta 3 (PCDHB3, Accession NM_018937.2) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB3.

[2785] Pou domain, class 4, transcription factor 2 (POU4F2, Accession NM_004575.1) is another GAM32 target gene, herein designated TARGET GENE. POU4F2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POU4F2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POU4F2 BINDING SITE, designated SEQ ID:19158, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2786] Another function of GAM32 is therefore inhibition of Pou domain, class 4, transcription factor 2 (POU4F2, Accession NM_004575.1) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with POU4F2.

[2787] PRO2266 (Accession) is another GAM32 target gene, herein designated TARGET GENE. PRO2266 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO2266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2266 BINDING SITE, designated SEQ ID:12617, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2788] Another function of GAM32 is therefore inhibition of PRO2266 (Accession) . Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2266.

[2789] Secreted phosphoprotein 1 (osteopontin, bone sialoprotein i, early t-lymphocyte activation 1) (SPP1, Accession NM_000582.1) is another GAM32 target gene, herein designated TARGET GENE. SPP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of SPP1 BINDING SITE, designated SEQ ID:13484, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2790] Another function of GAM32 is therefore inhibition of Secreted phosphoprotein 1 (osteopontin, bone sialoprotein i, early t-lymphocyte activation 1) (SPP1, Accession NM_000582.1), a gene which binds tightly to hydroxyapatite. appears to form an integral part of the mineralized matrix. probably important to cell- matrix interaction. and therefore may be associated with Urinary stone formation. Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of Urinary stone formation, and of other diseases and clinical conditions associated with SPP1.

[2791] The function of SPP1 has been established by previous studies. Kohri et al. (1992) sequenced a cDNA of urinary stone protein, the proteinaceous matrix of urinary stones. The sequence showed complete homology with that of osteopontin. Furthermore, Kohri et al. (1993) showed that urinary calcium oxalate stones consist of osteopontin protein. By means of in situ hybridization, they demonstrated osteopontin mRNA in the kidney, specifically in the distal tubular cells. In a rat model of stone formation in-

duced with glyoxylic acid, they found that staining for osteopontin was remarkably increased in distal tubular cells, whereas proximal tubular cells and glomeruli remained negative as in the normal kidney. Two genes, TAP1 (OMIM Ref. No. 170260) and SCYD1 (encoding fractalkine; 601880), may contribute to suppress tumor growth through host immunosurveillance. These genes were identified as downstream targets of the TP53 tumor suppressor gene (OMIM Ref. No. 191170). As noted by Ashkar et al. (2000), osteopontin is one of the key cytokines for type 1 immune responses mediated by macrophages in mice. Osteopontin may also play a role in suppressing tumor growth in vivo. Morimoto et al. (2002) identified the OPN gene as a TP53 target gene and found that its expression was upregulated by DNA damage- induced TP53 activity and by adenovirus- mediated transfer of the human TP53 gene. They demonstrated that the OPN gene has a functional TP53- responsive element in its promoter region and confirmed an interaction between the OPN promoter and Tp53 protein in vivo. The results suggested that OPN is a direct transcriptional target of TP53. The TP53- directed regulation of OPN expression suggested a novel mechanism of TP53 participation in immunosurveil-

lance, involving interaction with the host immune system to prevent damaged cells from undergoing malignant transformation.

[2792] Animal model experiments lend further support to the function of SPP1. Ashkar et al. (2000) reported that mice deficient in osteopontin gene expression have severely impaired type 1 immunity to viral infection and bacterial infection and do not develop sarcoid- type granulomas. IL12 (see OMIM Ref. No. 161560) and interferon- gamma (OMIM Ref. No. 147570) production is diminished, and IL10 (OMIM Ref. No. 124092) production is increased. A phosphorylation- dependent interaction between the amino- terminal portion of osteopontin and its integrin receptor stimulated IL12 expression, whereas phosphorylation- independent interaction with CD44 inhibited IL10 expression. Ashkar et al. (2000) concluded that osteopontin is a key cytokine that sets the stage for efficient type 1 immune responses through differential regulation of macrophage IL12 and IL10 cytokine expression.

[2793] It is appreciated that the abovementioned animal model for SPP1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2794] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2795] Kohri, K.; Nomura, S.; Kitamura, Y.; Nagata, T.; Yoshioka, K.; Iguchi, M.; Yamate, T.; Umekawa, T.; Suzuki, Y.; Sinohara, H.; Kurita, T. : Structure and expression of the mRNA encoding urinary stone protein (osteopontin). J. Biol. Chem. 268: 15180- 15184, 1993. ; and

[2796] Ashkar, S.; Weber, G. F.; Panoutsakopoulou, V.; Sanchirico, M. E.; Jansson, M.; Zawaideh, S.; Rittling, S. R.; Denhardt, D. T.; Glimchar, M. J.; Cantor, H. : Eta- 1 (osteopontin): an early c.

[2797] Further studies establishing the function and utilities of SPP1 are found in John Hopkins OMIM database record ID 166490, and in cited publications listed in Table 5, which are hereby incorporated by reference.Timeless homolog (drosophila) (TIMELESS, Accession NM_003920.1) is another GAM32 target gene, herein designated TARGET GENE. TIMELESS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIMELESS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of TIMELESS BINDING SITE, designated SEQ ID:11356, to the nucleotide sequence of GAM32 RNA, herein designated GAM RNA, also designated SEQ ID:384.

[2798] Another function of GAM32 is therefore inhibition of Timeless homolog (drosophila) (TIMELESS, Accession NM_003920.1), a gene which involves in circadian oscillation autoregulation. Accordingly, utilities of GAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMELESS.

[2799] The function of TIMELESS has been established by previous studies. Cellular pacemakers located in the suprachiasmatic nucleus (SCN) of the anterior hypothalamus control circadian rhythms. In Drosophila, a central clock mechanism involves the dynamic regulation of 2 genes, 'period' (per; OMIM Ref. No. 602260) and 'timeless' (tim), which physically interact and participate in an intracellular transcriptional/translational feedback loop. The transcription of per and tim is positively regulated by the Clock (OMIM Ref. No. 601851) and BMAL1 (OMIM Ref. No. 602550) proteins, which form heterodimers. By searching EST databases, Sangoram et al. (1998), Zylka et al. (1998), and Koike et al. (1998) identified cDNAs corresponding to human (TIM) and mouse (Tim) homologs of Drosophila

timeless. Sangoram et al. (1998) reported that the predicted 1,208- amino acid human protein is 84% identical to mouse Tim. The mammalian proteins share 4 regions of homology with Drosophila tim, including regions involved in nuclear localization, protein- protein interaction with PER, and cytoplasmic localization. Northern blot analysis revealed that TIM was expressed as a 4.5- kb mRNA in all human tissues tested, with the highest levels in placenta, pancreas, thymus, and testis. In situ hybridization indicated that unlike those of Drosophila, mouse Tim transcript levels do not oscillate in the SCN or in the retina. Sangoram et al. (1998) demonstrated that human TIM interacts with Drosophila per, mouse PER1, and mouse PER2 (see OMIM Ref. No. 603426) in vitro. When expressed in Drosophila cells, TIM mimicked a Drosophila tim cellular function by interacting with Drosophila per and translocating into the nucleus. In addition, when expressed in mammalian cells, human TIM and mouse PER1 specifically inhibited CLOCK- BMAL1- induced transactivation of the mouse PER1 promoter. These authors concluded that TIM and Tim are the mammalian orthologs of Drosophila tim. In contrast, Zylka et al. (1998) were unable to detect mouse Per- Tim interactions

in yeast 2- hybrid assays. They found an array of interactions between the various mouse Per proteins, and suggested that Per- Per interactions have replaced the function of Per- Tim dimers in the molecular workings of the mammalian circadian clock.

[2800]

[2801] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2802] Sangoram, A. M.; Saez, L.; Antoch, M. P.; Gekakis, N.; Staknis, D.; Whiteley, A.; Fruechte, E. M.; Vitaterna, M. H.; Shimomura, K.; King, D. P.; Young, M. W.; Weitz, C. J.; Takahashi, J. S. : Mammalian circadian autoregulatory loop: a timeless ortholog and mPer1 interact and negatively regulate CLOCK- BMAL1- induced transcription. Neuron 21: 1101- 1113, 1998. ; and

[2803] Zylka, M. J.; Shearman, L. P.; Levine, J. D.; Jin, X.; Weaver, D. R.; Reppert, S. M. : Molecular analysis of mammalian timeless. Neuron 21: 1115- 1122, 1998.

[2804] Further studies establishing the function and utilities of TIMELESS are found in John Hopkins OMIM database record ID 603887, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[2805] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 33 (GAM33), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[2806] GAM33 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM33 was detected is described hereinabove with reference to Figs. 8-15.

[2807] GAM33 gene, herein designated GAM GENE, and GAM33 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2808] GAM33 gene encodes a GAM33 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM33 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM33 precursor RNA is designated SEQ ID:77, and is provided hereinbelow with reference to the sequence listing part.

[2809] GAM33 precursor RNA folds onto itself, forming GAM33 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2810] GAM33 precursor RNA folds onto itself, forming GAM33 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2811] Nucleotide sequence of GAM33 precursor RNA, designated SEQ-ID: 77, and a schematic representation of a predicted secondary folding of GAM33 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2812] An enzyme complex designated DICER COMPLEX, `dices` the GAM33 folded precursor RNA into GAM33 RNA, herein

designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM33 RNA is designated SEQ ID:317, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2813] GAM33 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM33 target RNA, herein designated GAM TARGET RNA. GAM33 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2814] GAM33 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM33 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM33 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM33 RNA may have a different number of target binding sites in untranslated regions of a GAM33 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2815] The complementary binding of GAM33 RNA, herein designated GAM RNA, to target binding sites on GAM33 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM33 target RNA into GAM33 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2816] It is appreciated that GAM33 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM33 target genes. The mRNA of each one of this plu-

rality of GAM33 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM33 RNA, herein designated GAM RNA, and which when bound by GAM33 RNA causes inhibition of translation of respective one or more GAM33 target proteins.

[2817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM33 gene, herein designated GAM GENE, on one or more GAM33 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[2818] It is appreciated that specific functions and accordingly

utilities of GAM33 correlate with, and may be deduced from, the identity of the target genes which GAM33 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2819]

[2820]

[2821] KIAA0940 (Accession NM_014912.1) is a GAM33 target gene, herein designated TARGET GENE. KIAA0940 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0940, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE, designated SEQ ID:14036, to the nucleotide sequence of GAM33 RNA, herein designated GAM RNA, also designated SEQ ID:317.

[2822] A function of GAM33 is therefore inhibition of KIAA0940 (Accession NM_014912.1) . Accordingly, utilities of GAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940.

[2823] LOC133688 (Accession) is another GAM33 target gene,

herein designated TARGET GENE. LOC133688 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC133688, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133688 BINDING SITE, designated SEQ ID:18335, to the nucleotide sequence of GAM33 RNA, herein designated GAM RNA, also designated SEQ ID:317.

[2824] Another function of GAM33 is therefore inhibition of LOC133688 (Accession) . Accordingly, utilities of GAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133688.

[2825] LOC159199 (Accession) is another GAM33 target gene, herein designated TARGET GENE. LOC159199 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC159199, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:6634, to the nucleotide sequence of GAM33 RNA, herein designated GAM RNA, also designated SEQ ID:317.

[2826] Another function of GAM33 is therefore inhibition of LOC159199 (Accession) . Accordingly, utilities of GAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159199.

[2827] LOC205360 (Accession) is another GAM33 target gene, herein designated TARGET GENE. LOC205360 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC205360, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC205360 BINDING SITE, designated SEQ ID:17537, to the nucleotide sequence of GAM33 RNA, herein designated GAM RNA, also designated SEQ ID:317.

[2828] Another function of GAM33 is therefore inhibition of LOC205360 (Accession) . Accordingly, utilities of GAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205360.

[2829]

[2830] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 34 (GAM34), which modulates expression of respective target

genes thereof, the function and utility of which target genes is known in the art.

[2831] GAM34 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM34 was detected is described hereinabove with reference to Figs. 8-15.

[2832] GAM34 gene, herein designated GAM GENE, and GAM34 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2833] GAM34 gene encodes a GAM34 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM34 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM34 precursor RNA is designated SEQ ID:59, and is provided hereinbelow with reference to the sequence listing part.

[2834] GAM34 precursor RNA folds onto itself, forming GAM34 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2835] GAM34 precursor RNA folds onto itself, forming GAM34 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2836] Nucleotide sequence of GAM34 precursor RNA, designated SEQ-ID: 59, and a schematic representation of a predicted secondary folding of GAM34 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2837] An enzyme complex designated DICER COMPLEX, `dices` the GAM34 folded precursor RNA into GAM34 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising

an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM34 RNA is designated SEQ ID:314, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2838] GAM34 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM34 target RNA, herein designated GAM TARGET RNA. GAM34 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2839] GAM34 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM34 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM34 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM34 RNA may have a different number of target binding sites in untranslated regions of a GAM34 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2840] The complementary binding of GAM34 RNA, herein designated GAM RNA, to target binding sites on GAM34 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM34 target RNA into GAM34 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2841] It is appreciated that GAM34 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM34 target genes. The mRNA of each one of this plurality of GAM34 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM34 RNA, herein designated GAM RNA, and which when bound by

GAM34 RNA causes inhibition of translation of respective one or more GAM34 target proteins.

[2842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM34 gene, herein designated GAM GENE, on one or more GAM34 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[2843] It is appreciated that specific functions and accordingly utilities of GAM34 correlate with, and may be deduced from, the identity of the target genes which GAM34 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2844]

[2845]

[2846] DKFZP434C171 (Accession NM_015621.1) is a GAM34 target gene, herein designated TARGET GENE. DKFZP434C171 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C171, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434C171 BINDING SITE, designated SEQ ID:6705, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2847] A function of GAM34 is therefore inhibition of DKFZP434C171 (Accession NM_015621.1) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C171.

[2848] FLJ10583 (Accession) is another GAM34 target gene, herein designated TARGET GENE. FLJ10583 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10583, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10583 BINDING SITE, designated SEQ ID:13120, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2849] Another function of GAM34 is therefore inhibition of FLJ10583 (Accession) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10583.

[2850] FLJ12587 (Accession NM_022480.2) is another GAM34 target gene, herein designated TARGET GENE. FLJ12587 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12587, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12587 BINDING SITE, designated SEQ ID:11111, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2851] Another function of GAM34 is therefore inhibition of FLJ12587 (Accession NM_022480.2) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ12587.

[2852] FLJ21841 (Accession NM_024609.1) is another GAM34 target gene, herein designated TARGET GENE. FLJ21841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21841 BINDING SITE, designated SEQ ID:6943, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2853] Another function of GAM34 is therefore inhibition of FLJ21841 (Accession NM_024609.1) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21841.

[2854] FLJ22559 (Accession NM_024928.2) is another GAM34 target gene, herein designated TARGET GENE. FLJ22559 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22559, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22559 BINDING SITE, designated SEQ ID:12516, to the

nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2855] Another function of GAM34 is therefore inhibition of FLJ22559 (Accession NM_024928.2) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22559.

[2856] FLJ31762 (Accession) is another GAM34 target gene, herein designated TARGET GENE. FLJ31762 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31762, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31762 BINDING SITE, designated SEQ ID:6375, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2857] Another function of GAM34 is therefore inhibition of FLJ31762 (Accession) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31762.

[2858] KIAA0662 (Accession) is another GAM34 target gene, herein designated TARGET GENE. KIAA0662 BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by KIAA0662, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0662 BINDING SITE, designated SEQ ID:12553, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2859] Another function of GAM34 is therefore inhibition of KIAA0662 (Accession) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0662.

[2860] LOC144317 (Accession XM_084813.4) is another GAM34 target gene, herein designated TARGET GENE. LOC144317 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144317, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144317 BINDING SITE, designated SEQ ID:5515, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2861] Another function of GAM34 is therefore inhibition of LOC144317 (Accession XM_084813.4) . Accordingly, utili-

ties of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144317.

[2862] LOC148166 (Accession XM_086077.1) is another GAM34 target gene, herein designated TARGET GENE. LOC148166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148166 BINDING SITE, designated SEQ ID:2036, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2863] Another function of GAM34 is therefore inhibition of LOC148166 (Accession XM_086077.1) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148166.

[2864] LOC149134 (Accession XM_097594.1) is another GAM34 target gene, herein designated TARGET GENE. LOC149134 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149134, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149134 BINDING SITE, designated SEQ ID:2210, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2865] Another function of GAM34 is therefore inhibition of LOC149134 (Accession XM_097594.1) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149134.

[2866] LOC169611 (Accession XM_095809.4) is another GAM34 target gene, herein designated TARGET GENE. LOC169611 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC169611, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:7929, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2867] Another function of GAM34 is therefore inhibition of LOC169611 (Accession XM_095809.4) . Accordingly, utilities of GAM34 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC169611.

[2868] Nerve growth factor, beta polypeptide (NGFB, Accession NM_002506.1) is another GAM34 target gene, herein designated TARGET GENE. NGFB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NGFB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NGFB BINDING SITE, designated SEQ ID:7978, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2869] Another function of GAM34 is therefore inhibition of Nerve growth factor, beta polypeptide (NGFB, Accession NM_002506.1), a gene which is important for the development and maintenance of the sympathetic and sensory nervous systems. Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFB.

[2870] The function of NGFB has been established by previous studies. Nerve growth factor is a polypeptide involved in the regulation of growth and differentiation of sympathetic and certain sensory neurons. (See review by Levi-

Montalcini, 1987.) Ullrich et al. (1983) showed that the nucleotide sequence of human and mouse beta- NGF are very similar. NGF consists of 3 types of subunits, alpha, beta and gamma, which specifically interact to form a 7S, 130,000- molecular weight complex. This complex contains 2 identical 118- amino acid beta- chains, which are solely responsible for nerve growth stimulating activity of NGF. Human DNA fragments coding for NGF were identified by Zabel et al. (1984) using a mouse submaxillary cDNA probe. In somatic cell hybrid studies they found that the human HindIII DNA fragments for NGF, as demonstrated in Southern blots, cosegregated with chromosome 1. Using a cell line with a 1;2 translocation, they narrowed the assignment to 1p21- pter. This is the same area as that implicated cytogenetically in neuroblastoma (1p32-pter) and the segment containing a neuroblastoma- related RAS oncogene. Furthermore, abnormality of NGF had been suspected, with some supporting evidence, in familial dysautonomia (OMIM Ref. No. 223900) and in 2 forms of neurofibromatosis (101000, 162200). The use of the 'candidate gene' approach to mapping disease and determining its cause is illustrated by the work of Breakefield et al. (1984). Using a cloned genomic probe for human beta-

NGF, they identified RFLPs in the beta- NGF gene, and in 4 informative families with 2 children with familial dysautonomia found 'no consistent co- inheritance of specific alleles with the disease.' Thus, they appear to have excluded a defect in or near the structural gene for beta-NGF as the cause of familial dysautonomia. Using 2 RFLPs related to the beta- NGF gene, Darby et al. (1985) could exclude this gene as the site of the mutation in 4 families with neurofibromatosis of the classic type (OMIM Ref. No. 162200). Using fragments of a cloned human gene for the beta subunit of nerve growth factor as hybridization probes in somatic cell hybrid studies, Francke et al. (1983) mapped the NGFB locus to 1p22. Oncogene NRAS (OMIM Ref. No. 164790) maps to the same band. Both nerve growth factor and epidermal growth factor (OMIM Ref. No. 131530) are on mouse chromosome 3; in man they are on different chromosomes (Zabel et al., 1985). Both factors are present in unusually high levels in male mouse submaxillary glands and both show similarities in temporal activation during development and androgen regulation. There is no known structural homology between them, however. Arguing from comparative mapping data, Zabel et al. (1985) suggested that the NGFB locus is localized in

the p22.1 to distal p21 region of chromosome 1. The distal part of human 1p shows conserved homology with mouse chromosome 4. The region of homology includes the genes ENO1, PGD, GDH, AK2, and PGM1. The conserved segment extends to PGM1 (homologous to mouse Pgm- 2), which is localized to human 1p22.1. From about 1p22.1 toward the centromere, there is a region of homology to mouse chromosome 3. This region contains AMY1 and AMY2 in mouse and man and NGF in the mouse. AMY is mapped to human 1p21. Using a method for improved resolution of in situ hybridization, Middleton- Price et al. (1987) concluded that NGFB is located within band 1p13. This explains the apparently anomalous linkage data between NGFB and PGM1, both of which had previously been assigned to 1p22.1 but showed no positive linkage. Garson et al. (1987) confirmed the assignment of NGFB to 1p13. The confusion has, however, not been completely dispelled. According to Dracopoli (1988), NGFB is telomeric to TSHB (OMIM Ref. No. 188540). The 2 loci are in the same 100- kb PFGE fragment, show virtually no recombination (lod = 43 at theta = 0.0), and are antithetically regulated by thyroid hormone (Dracopoli et al., 1988), yet TSHB has been mapped

to 1p22. Dracopoli and Meisler (1990) concluded from linkage analysis and pulsed field gel electrophoresis that TSHB, NGFB, and NRAS form a tightly linked gene cluster located in the same chromosomal band. Their location proximal to the AMY2B gene in 1p21 and close linkage to the alpha- satellite centromeric repeat D1Z5 provided strong evidence that the correct assignment for these 3 loci is 1p13 and not 1p22. By fluorescence in situ hybridization, Mitchell et al. (1995) mapped NGFB to 1p13.1.

[2871]

[2872] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2873] Ullrich, A.; Gray, A.; Berman, C.; Dull, T. J. : Human beta-nerve growth factor gene sequence highly homologous to that of mouse. Nature 303: 821- 825, 1983. ; and

[2874] Zabel, B. U.; Eddy, R. L.; Lalley, P. A.; Scott, J.; Bell, G. I.; Shows, T. B. : Chromosomal locations of the human and mouse genes for precursors of epidermal growth factor and the b.

[2875] Further studies establishing the function and utilities of NGFB are found in John Hopkins OMIM database record ID 162030, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Rad50 homolog (s. cerevisiae) (RAD50, Accession NM_005732.2) is another GAM34 target gene, herein designated TARGET GENE. RAD50 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAD50, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE, designated SEQ ID:15035, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2876] Another function of GAM34 is therefore inhibition of Rad50 homolog (s. cerevisiae) (RAD50, Accession NM_005732.2), a gene which is involved in dna double-strand break repair (dsbr). and therefore may be associated with Myeloid leukemia and breast cancer. Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of Myeloid leukemia and breast cancer, and of other diseases and clinical conditions associated with RAD50.

[2877] The function of RAD50 has been established by previous studies. The S. cerevisiae Rad50 gene encodes a protein that is essential for double- stranded DNA break repair by

nonhomologous DNA end joining and chromosomal integration. The yeast Rad50, Mre11 (OMIM Ref. No. 600814), and Xrs2 proteins appear to act in a multiprotein complex, consistent with the observation that mutations in these genes confer nearly identical phenotypes of no meiotic recombination and elevated rates of homologous mitotic recombination. By direct selection of cDNAs from the 5q23-q31 chromosomal interval, Dolganov et al. (1996) isolated a cDNA encoding a human Rad50 homolog. The human RAD50 gene spans 100 to 130 kb. Northern blot analysis revealed that the RAD50 gene was expressed as a 5.5- kb mRNA predominantly in testis. A faint 7- kb transcript, which the authors considered to be an mRNA with an alternatively processed 3- prime end, was also detected. Yeast Rad50 and the predicted 1,312- amino acid human RAD50 protein share more than 50% identity in their N- and C- termini. The central heptad repeat domains of the proteins have relatively divergent primary sequences but are predicted to adopt very similar coiled- coil structures. Using immunoprecipitation, Dolganov et al. (1996) demonstrated that the 153- kD RAD50 is stably associated with MRE11 in a protein complex, which may also include proteins of 95 kD, 200 kD, and 350 kD. By inclusion

within mapped clones and by analysis of somatic cell hybrids, Dolganov et al. (1996) mapped the RAD50 gene to 5q31. They suggested that a recombinational DNA repair deficiency may be associated with the development of myeloid leukemia, since this chromosomal region is frequently altered in acute myeloid leukemia and myelodysplastic disease.

[2878]

[2879] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2880] Dolganov, G. M.; Maser, R. S.; Novikov, A.; Tosto, L.; Chong, S.; Bressan, D. A.; Petrini, J. H. J. : Human Rad50 is physically associated with human Mre11: identification of a conserved multiprotein complex implicated in recombinational DNA repair. Molec. Cell Biol. 16: 4832- 4841, 1996. ; and

[2881] Hopfner, K.- P.; Craig, L.; Moncalian, G.; Zinkel, R. A.; Usui, T.; Owen, B. A. L.; Karcher, A.; Henderson, B.; Bodmer, J.- L.; McMurray, C. T.; Carney, J. P.; Petrini, J. H. J.; Tainer.

[2882] Further studies establishing the function and utilities of RAD50 are found in John Hopkins OMIM database record

ID 604040, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ribonuclease, rnase a family, 4 (RNASE4, Accession NM_002937.2) is another GAM34 target gene, herein designated TARGET GENE. RNASE4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNASE4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNASE4 BINDING SITE, designated SEQ ID:1775, to the nucleotide sequence of GAM34 RNA, herein designated GAM RNA, also designated SEQ ID:314.

[2883] Another function of GAM34 is therefore inhibition of Ribonuclease, rnase a family, 4 (RNASE4, Accession NM_002937.2) . Accordingly, utilities of GAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE4.

[2884]

[2885] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 35 (GAM35), which modulates expression of respective target genes thereof, the function and utility of which target

genes is known in the art.

[2886] GAM35 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM35 was detected is described hereinabove with reference to Figs. 8-15.

[2887] GAM35 gene, herein designated GAM GENE, and GAM35 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2888] GAM35 gene encodes a GAM35 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM35 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM35 precursor RNA is designated SEQ ID:101, and is provided hereinbelow with reference to the sequence listing part.

[2889] GAM35 precursor RNA folds onto itself, forming GAM35 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2890] GAM35 precursor RNA folds onto itself, forming GAM35 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2891] Nucleotide sequence of GAM35 precursor RNA, designated SEQ-ID: 101, and a schematic representation of a predicted secondary folding of GAM35 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2892] An enzyme complex designated DICER COMPLEX, `dices` the GAM35 folded precursor RNA into GAM35 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary

proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM35 RNA is designated SEQ ID:247, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2893] GAM35 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM35 target RNA, herein designated GAM TARGET RNA. GAM35 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2894] GAM35 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM35 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM35 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is

meant as an illustration only, and is not meant to be limiting GAM35 RNA may have a different number of target binding sites in untranslated regions of a GAM35 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2895] The complementary binding of GAM35 RNA, herein designated GAM RNA, to target binding sites on GAM35 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM35 target RNA into GAM35 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2896] It is appreciated that GAM35 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM35 target genes. The mRNA of each one of this plurality of GAM35 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM35 RNA, herein designated GAM RNA, and which when bound by GAM35 RNA causes inhibition of translation of respective

one or more GAM35 target proteins.

[2897] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM35 gene, herein designated GAM GENE, on one or more GAM35 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[2898] It is appreciated that specific functions and accordingly utilities of GAM35 correlate with, and may be deduced from, the identity of the target genes which GAM35 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2899]

[2900]

[2901] LOC144558 (Accession) is a GAM35 target gene, herein designated TARGET GENE. LOC144558 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144558, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144558 BINDING SITE, designated SEQ ID:14499, to the nucleotide sequence of GAM35 RNA, herein designated GAM RNA, also designated SEQ ID:247.

[2902] A function of GAM35 is therefore inhibition of LOC144558 (Accession) . Accordingly, utilities of GAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144558.

[2903] LOC144871 (Accession XM_096698.4) is another GAM35 target gene, herein designated TARGET GENE. LOC144871 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144871, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:6700, to

the nucleotide sequence of GAM35 RNA, herein designated GAM RNA, also designated SEQ ID:247.

[2904] Another function of GAM35 is therefore inhibition of LOC144871 (Accession XM_096698.4) . Accordingly, utilities of GAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871.

[2905] LOC51652 (Accession) is another GAM35 target gene, herein designated TARGET GENE. LOC51652 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51652, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51652 BINDING SITE, designated SEQ ID:17491, to the nucleotide sequence of GAM35 RNA, herein designated GAM RNA, also designated SEQ ID:247.

[2906] Another function of GAM35 is therefore inhibition of LOC51652 (Accession) . Accordingly, utilities of GAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51652.

[2907] My015 (Accession) is another GAM35 target gene, herein designated TARGET GENE. My015 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by My015, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:12036, to the nucleotide sequence of GAM35 RNA, herein designated GAM RNA, also designated SEQ ID:247.

[2908] Another function of GAM35 is therefore inhibition of My015 (Accession) . Accordingly, utilities of GAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015.

[2909]

[2910] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 36 (GAM36), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[2911] GAM36 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM36 was detected is described hereinabove with reference to Figs. 8-15.

[2912] GAM36 gene, herein designated GAM GENE, and GAM36

target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2913] GAM36 gene encodes a GAM36 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM36 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM36 precursor RNA is designated SEQ ID:149, and is provided hereinbelow with reference to the sequence listing part.

[2914] GAM36 precursor RNA folds onto itself, forming GAM36 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2915] GAM36 precursor RNA folds onto itself, forming GAM36 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2916] Nucleotide sequence of GAM36 precursor RNA, designated SEQ-ID: 149, and a schematic representation of a predicted secondary folding of GAM36 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2917] An enzyme complex designated DICER COMPLEX, `dices` the GAM36 folded precursor RNA into GAM36 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM36 RNA is designated SEQ ID:351, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2918] GAM36 target gene, herein designated TARGET GENE, en-

codes a corresponding messenger RNA, GAM36 target RNA, herein designated GAM TARGET RNA. GAM36 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2919] GAM36 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM36 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM36 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM36 RNA may have a different number of target binding sites in untranslated regions of a GAM36 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2920] The complementary binding of GAM36 RNA, herein designated GAM RNA, to target binding sites on GAM36 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM36 target RNA into GAM36 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2921] It is appreciated that GAM36 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM36 target genes. The mRNA of each one of this plurality of GAM36 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM36 RNA, herein designated GAM RNA, and which when bound by GAM36 RNA causes inhibition of translation of respective one or more GAM36 target proteins.

[2922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM36 gene, herein designated GAM GENE, on one or more GAM36 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[2923] It is appreciated that specific functions and accordingly utilities of GAM36 correlate with, and may be deduced from, the identity of the target genes which GAM36 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2924]

[2925]

[2926] CIS4 (Accession) is a GAM36 target gene, herein designated TARGET GENE. CIS4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CIS4, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIS4 BINDING SITE, designated SEQ ID:11967, to the nucleotide sequence of GAM36 RNA, herein designated GAM RNA, also designated SEQ ID:351.

[2927] A function of GAM36 is therefore inhibition of CIS4 (Accession) . Accordingly, utilities of GAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIS4.

[2928] Fibroblast growth factor 2 (basic) (FGF2, Accession NM_002006.2) is another GAM36 target gene, herein designated TARGET GENE. FGF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FGF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:14146, to the nucleotide sequence of GAM36 RNA, herein designated GAM RNA, also designated SEQ ID:351.

[2929] Another function of GAM36 is therefore inhibition of Fibroblast growth factor 2 (basic) (FGF2, Accession NM_002006.2), a gene which the Basic fibroblast growth factor 2; is mitogenic, angiogenic, and neurotrophic fac-

tor. Accordingly, utilities of GAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2.

[2930] The function of FGF2 has been established by previous studies. See fibroblast growth factor- 12 (FGF12; 601513). By Southern blot hybridization of genomic DNA from rodent/human hybrid cell lines carrying individual human chromosomes, Smallwood et al. (1996) mapped the FHF2 gene (also symbolized FGF13) to the X chromosome. By using an interspecific backcross mapping panel, they demonstrated that the mouse gene, Fhf2, shows no recombination with the gene for CD40 antigen ligand (OMIM Ref. No. 300386). Thus the human gene is probably located at Xq26. By use of isotopic in situ hybridization, Lovec et al. (1997) assigned the FHF2 gene to Xq21. Gecz et al. (1999), however, provided evidence that the FHF2 gene is located in Xq26.3. They identified a male patient with features of Borjeson- Forssman- Lehmann syndrome (BFLS; 301900) and a duplication of the Xq26-q28 region. By FISH using YAC clones from Xq26, they localized the duplication breakpoint to an interval of approximately 400 kb in the Xq26.3 region between DXS155 and DXS294/DXS730. Database searches and an analysis

of available genomic sequence from the region showed that the FHF2 gene is located within the duplication breakpoint interval. Gecz et al. (1999) determined the structure of the FHF2 gene and identified 2 new exons, including a new 5- prime end exon, designated 1B. FHF2 is a large gene, extending over approximately 200 kb in Xq26.3, and contains at least 7 exons. It shows tissue-specific alternative splicing and alternative transcription starts. Northern blot hybridization showed highest expression in brain and skeletal muscle. The localization and tissue- specific expression pattern of FHF2 made it a possible candidate gene for familial cases of BFLS and for other syndromal and nonspecific forms of X- linked mental retardation mapping to that region.

[2931] Animal model experiments lend further support to the function of FGF2.

[2932] It is appreciated that the abovementioned animal model for FGF2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2933] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2934] Gecz, J.; Baker, E.; Donnelly, A.; Ming, J. E.; McDonald-McGinn, D. M.; Spinner, N. B.; Zackai, E. H.; Sutherland, G. R.; Mulley, J. C. : Fibroblast growth factor homologous factor 2 (FHF2): gene structure, expression and mapping to the Borjeson- Forssman- Lehmann syndrome region in Xq26 delineated by a duplication breakpoint in a BFLS-like patient. Hum. Genet. 104: 56- 63, 1999. ; and

[2935] Lovec, H.; Hartung, H.; Verdier, A.- S.; Mattei, M.- G.; Birnbaum, D.; Goldfarb, M.; Coulier, F. : Assignment of FGF13 to human chromosome band Xq21 by in situ hybridization. Cytogenet.

[2936] Further studies establishing the function and utilities of FGF2 are found in John Hopkins OMIM database record ID 134920, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC147837 (Accession NM_145276.1) is another GAM36 target gene, herein designated TARGET GENE. LOC147837 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:13329, to

the nucleotide sequence of GAM36 RNA, herein designated GAM RNA, also designated SEQ ID:351.

[2937] Another function of GAM36 is therefore inhibition of LOC147837 (Accession NM_145276.1) . Accordingly, utilities of GAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837.

[2938] Latrophilin 1 (LPHH1, Accession NM_012302.1) is another GAM36 target gene, herein designated TARGET GENE. LPHH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LPHH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LPHH1 BINDING SITE, designated SEQ ID:8148, to the nucleotide sequence of GAM36 RNA, herein designated GAM RNA, also designated SEQ ID:351.

[2939] Another function of GAM36 is therefore inhibition of Latrophilin 1 (LPHH1, Accession NM_012302.1), a gene which probably involved in cell adhesion within tissues and receptor signalling and therefore may be associated with Cancer. Accordingly, utilities of GAM36 include diagnosis, prevention and treatment of Cancer, and of other diseases

and clinical conditions associated with LPHH1.

[2940] The function of LPHH1 has been established by previous studies. In a study of breast tumor samples, Hoggard et al. (1995) reported a region, 1p31.1, with a high frequency of loss of heterozygosity (LOH). In order to identify candidate sequences, mutation of which might contribute to the development of breast cancer, White et al. (1998) carried out mapping studies of ESTs localized to 1p31.1. They identified and characterized a novel gene, LPHH1 (latrophilin homolog- 1), located adjacent to the smallest region of overlapping loss seen in tumors. The 4,209- bp open reading frame of the 7- kb LPHH1 transcript encoded a peptide that showed approximately 65% identity to rat latrophilin, a G- coupled, 7- span transmembrane protein that binds alpha- latrotoxin. Surprisingly, while expression of the rat gene was strictly restricted to neurologic and perhaps some endocrine cells, the human sequence appeared to be expressed very widely in all normal tissues tested. The range of transcripts encoded in a breast tumor cell line, compared to normal breast, suggested that gene product variability was higher in the tumor

[2941]

[2942] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2943] Hoggard, N.; Brintell, B.; Howell, A.; Weissenbach, J.; Varley, J. : Allelic imbalance on chromosome 1 in human breast cancer. II. Microsatellite repeat analysis. Genes Chromosomes Cancer 12: 24- 31, 1995. ; and

[2944] White, G. R. M.; Varley, J. M.; Heighway, J. : Isolation and characterization of a human homologue of the latrophilin gene from a region of 1p31.1 implicated in breast cancer. Oncogene 17:.

[2945] Further studies establishing the function and utilities of LPHH1 are found in John Hopkins OMIM database record ID 607018, and in cited publications listed in Table 5, which are hereby incorporated by reference.Oxysterol binding protein-like 10 (OSBPL10, Accession NM_017784.3) is another GAM36 target gene, herein designated TARGET GENE. OSBPL10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OSBPL10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL10 BINDING SITE, des-

ignated SEQ ID:19783, to the nucleotide sequence of GAM36 RNA, herein designated GAM RNA, also designated SEQ ID:351.

[2946] Another function of GAM36 is therefore inhibition of Oxysterol binding protein-like 10 (OSBPL10, Accession NM_017784.3) . Accordingly, utilities of GAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL10.

[2947] Reticulon 4 interacting protein 1 (RTN4IP1, Accession NM_032730.1) is another GAM36 target gene, herein designated TARGET GENE. RTN4IP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RTN4IP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RTN4IP1 BINDING SITE, designated SEQ ID:14226, to the nucleotide sequence of GAM36 RNA, herein designated GAM RNA, also designated SEQ ID:351.

[2948] Another function of GAM36 is therefore inhibition of Reticulon 4 interacting protein 1 (RTN4IP1, Accession NM_032730.1) . Accordingly, utilities of GAM36 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RTN4IP1.

[2949]

[2950] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 37 (GAM37), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[2951] GAM37 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM37 was detected is described hereinabove with reference to Figs. 8-15.

[2952] GAM37 gene, herein designated GAM GENE, and GAM37 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2953] GAM37 gene encodes a GAM37 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM37 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM37 precursor RNA is designated SEQ ID:197, and is provided hereinbelow with reference to the sequence listing part.

[2954] GAM37 precursor RNA folds onto itself, forming GAM37 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2955] GAM37 precursor RNA folds onto itself, forming GAM37 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2956] Nucleotide sequence of GAM37 precursor RNA, designated SEQ-ID: 197, and a schematic representation of a predicted secondary folding of GAM37 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2957] An enzyme complex designated DICER COMPLEX, `dices` the GAM37 folded precursor RNA into GAM37 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM37 RNA is designated SEQ ID:266, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2958] GAM37 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM37 target RNA, herein designated GAM TARGET RNA. GAM37 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2959] GAM37 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM37 target RNA, herein designated GAM TARGET RNA. This complementary binding is

due to the fact that the nucleotide sequence of GAM37 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM37 RNA may have a different number of target binding sites in untranslated regions of a GAM37 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2960] The complementary binding of GAM37 RNA, herein designated GAM RNA, to target binding sites on GAM37 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM37 target RNA into GAM37 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2961] It is appreciated that GAM37 target gene, herein desig-

nated TARGET GENE, in fact represents a plurality of GAM37 target genes. The mRNA of each one of this plurality of GAM37 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM37 RNA, herein designated GAM RNA, and which when bound by GAM37 RNA causes inhibition of translation of respective one or more GAM37 target proteins.

[2962] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM37 gene, herein designated GAM GENE, on one or more GAM37 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a

tiny RNA world, Science 294,779 (2001)).

[2963] It is appreciated that specific functions and accordingly utilities of GAM37 correlate with, and may be deduced from, the identity of the target genes which GAM37 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2964]

[2965]

[2966] Clock homolog (mouse) (CLOCK, Accession NM_004898.2) is a GAM37 target gene, herein designated TARGET GENE. CLOCK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLOCK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLOCK BINDING SITE, designated SEQ ID:9594, to the nucleotide sequence of GAM37 RNA, herein designated GAM RNA, also designated SEQ ID:266.

[2967] A function of GAM37 is therefore inhibition of Clock homolog (mouse) (CLOCK, Accession NM_004898.2) . Accordingly, utilities of GAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with CLOCK.

[2968] HSC3 (Accession NM_145174.1) is another GAM37 target gene, herein designated TARGET GENE. HSC3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSC3 BINDING SITE, designated SEQ ID:19698, to the nucleotide sequence of GAM37 RNA, herein designated GAM RNA, also designated SEQ ID:266.

[2969] Another function of GAM37 is therefore inhibition of HSC3 (Accession NM_145174.1) . Accordingly, utilities of GAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSC3.

[2970] LOC151005 (Accession) is another GAM37 target gene, herein designated TARGET GENE. LOC151005 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151005, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151005 BINDING SITE, designated SEQ ID:12533, to

the nucleotide sequence of GAM37 RNA, herein designated GAM RNA, also designated SEQ ID:266.

[2971] Another function of GAM37 is therefore inhibition of LOC151005 (Accession) . Accordingly, utilities of GAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151005.

[2972] Staufen, rna binding protein (drosophila) (STAU, Accession NM_017454.1) is another GAM37 target gene, herein designated TARGET GENE. STAU BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STAU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAU BINDING SITE, designated SEQ ID:602, to the nucleotide sequence of GAM37 RNA, herein designated GAM RNA, also designated SEQ ID:266.

[2973] Another function of GAM37 is therefore inhibition of Staufen, rna binding protein (drosophila) (STAU, Accession NM_017454.1), a gene which may play a role in specific positioning of mrnas at given sites in the cell and in stimulating their translation at the site. Accordingly, utilities of GAM37 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with STAU.

[2974] The function of STAU has been established by previous studies. In Drosophila, genetic studies have identified a number of potential genes that are necessary for localization of mRNAs in oocytes, one of which is the staufen gene. The staufen gene product is a double- stranded RNA (dsRNA)- binding protein that contains several copies of a consensus dsRNA- binding domain (RBD). By searching an EST database for staufen- related sequences, Wickham et al. (1999) identified a partial cDNA encoding STAU, a human staufen homolog. Using RACE and library screening, they recovered additional cDNAs corresponding to the entire STAU coding region. Northern blot analysis indicated that the STAU gene was expressed as an unresolved band of approximately 3.6 kb in all tissues tested. Characterization of STAU cDNAs revealed that there are 4 different STAU transcripts encoding predicted 496- and 577- amino acid isoforms differing in their N- terminal extremities. Wickham et al. (1999) also cloned a mouse Stau cDNA. Mouse and human STAU are 90% identical on the amino acid level. The RBDs are well conserved between Drosophila and mammalian staufen proteins in terms of overall structure and relative positions, and share

47 to 66% identity. However, the mammalian proteins lack the first RBD found in Drosophila staufen and contain a putative microtubule- binding domain not found in the Drosophila protein. In vitro, STAU bound dsRNA and tubulin, suggesting that it crosslinks cytoskeletal and RNA components. In mammalian cells expressing epitope-tagged STAU, immunofluorescence experiments revealed that STAU is localized to the rough endoplasmic reticulum. Wickham et al. (1999) proposed that STAU plays a role in the targeting of RNA to its site of translation. The influenza virus nonstructural protein NS1 is an RNA-binding protein that may be involved in regulatory processes during viral infection, including pre- mRNA splicing, retention of poly(A)- containing RNA in the nucleus, and the stimulation of viral mRNA translation. Using a yeast 2- hybrid screen, Marion et al. (1999) identified staufen- like as a protein that bound NS1. By immunofluorescence, they localized endogenous staufen- like to the rough endoplasmic reticulum in HeLa cells. Sedimentation analyses indicated that staufen- like associates with polysomes in these cells. Marion et al. (1999) suggested that staufen- like might therefore play a dual role: positioning specific mRNAs at given sites in the cell, and stim-

ulating their translation at the site.

[2975]

[2976] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2977] Marion, R. M.; Fortes, P.; Beloso, A.; Dotti, C.; Ortin, J. : A human sequence homologue of staufen is an RNA- binding protein that is associated with polysomes and localizes to the rough endoplasmic reticulum. Molec. Cell. Biol. 19: 2212- 2219, 1999. ; and

[2978] Wickham, L.; Duchaine, T.; Luo, M.; Nabi, I. R.; DesGroseillers, L. : Mammalian staufen is a double- stranded-RNA- and tubulin- binding protein which localizes to the rough endoplasmic r.

[2979] Further studies establishing the function and utilities of STAU are found in John Hopkins OMIM database record ID 601716, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[2980] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 38 (GAM38), which modulates expression of respective target genes thereof, the function and utility of which target

genes is known in the art.

[2981] GAM38 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM38 was detected is described hereinabove with reference to Figs. 8-15.

[2982] GAM38 gene, herein designated GAM GENE, and GAM38 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[2983] GAM38 gene encodes a GAM38 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM38 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM38 precursor RNA is designated SEQ ID:89, and is provided hereinbelow with reference to the sequence listing part.

[2984] GAM38 precursor RNA folds onto itself, forming GAM38 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2985] GAM38 precursor RNA folds onto itself, forming GAM38 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[2986] Nucleotide sequence of GAM38 precursor RNA, designated SEQ-ID: 89, and a schematic representation of a predicted secondary folding of GAM38 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[2987] An enzyme complex designated DICER COMPLEX, `dices` the GAM38 folded precursor RNA into GAM38 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary

proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM38 RNA is designated SEQ ID:271, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[2988] GAM38 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM38 target RNA, herein designated GAM TARGET RNA. GAM38 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2989] GAM38 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM38 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM38 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is

meant as an illustration only, and is not meant to be limiting GAM38 RNA may have a different number of target binding sites in untranslated regions of a GAM38 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2990] The complementary binding of GAM38 RNA, herein designated GAM RNA, to target binding sites on GAM38 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM38 target RNA into GAM38 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[2991] It is appreciated that GAM38 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM38 target genes. The mRNA of each one of this plurality of GAM38 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM38 RNA, herein designated GAM RNA, and which when bound by GAM38 RNA causes inhibition of translation of respective

one or more GAM38 target proteins.

[2992] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM38 gene, herein designated GAM GENE, on one or more GAM38 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[2993] It is appreciated that specific functions and accordingly utilities of GAM38 correlate with, and may be deduced from, the identity of the target genes which GAM38 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2994]

[2995]

[2996] Cd34 antigen (CD34, Accession NM_001773.1) is a GAM38 target gene, herein designated TARGET GENE. CD34 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD34, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD34 BINDING SITE, designated SEQ ID:10905, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[2997] A function of GAM38 is therefore inhibition of Cd34 antigen (CD34, Accession NM_001773.1), a gene which is a monomeric cell surface antigen that is selectively expressed on human hematopoietic progenitor cells. Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD34.

[2998] The function of CD34 has been established by previous studies. CD34 is a monomeric cell surface antigen with a molecular mass of approximately 110 kD that is selectively expressed on human hematopoietic progenitor cells. In the hands of Sutherland et al. (1988), partial amino acid

analysis of highly purified CD34 antigen revealed no significant sequence similarity with any previously described structures. Sequential immunoprecipitation and Western blot analysis indicated that this antigen is not a member of the leukosialin/sialophorin family, despite the fact that these molecules share several structural similarities.

[2999] Animal model experiments lend further support to the function of CD34. To analyze the involvement of CD34 in hematopoiesis, Cheng et al. (1996) produced both embryonic stem (ES) cells in mice null for the expression of this mucin. Analysis of yolk sac- like hematopoietic development in embryoid bodies derived from CD34- null ES cells showed a significant delay in both erythroid and myeloid differentiation that could be reversed by transfection of the mutant ES cells with CD34 constructs expressing either a complete or truncated cytoplasmic domain. In spite of these diminished embryonic hematopoietic progenitor numbers, the CD34- null mice developed normally, and the hematopoietic profile of adult blood appeared typical. However, the colony- forming activity of hematopoietic progenitors derived from both bone marrow and spleen was significantly reduced in adult CD34- deficient animals.

[3000] It is appreciated that the abovementioned animal model for CD34 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3001] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3002] Cheng, J.; Baumhueter, S.; Cacalano, G.; Carver- Moore, K.; Thibodeaux, H.; Thomas, R.; Broxmeyer, H. E.; Cooper, S.; Hague, N.; Moore, M.; Lasky, L. A. : Hematopoietic defects in mice lacking the sialomucin CD34. Blood 87: 479-490, 1996. ; and

[3003] Sutherland, D. R.; Watt, S. M.; Dowden, G.; Karhi, K.; Baker, M. A.; Greaves, M. F.; Smart, J. E. : Structural and partial amino acid sequence analysis of the human hemopoietic progenito.

[3004] Further studies establishing the function and utilities of CD34 are found in John Hopkins OMIM database record ID 142230, and in cited publications listed in Table 5, which are hereby incorporated by reference.DKFZP434P211 (Accession NM_014549.1) is another GAM38 target gene, herein designated TARGET GENE. DKFZP434P211 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by DKFZP434P211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:15656, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3005] Another function of GAM38 is therefore inhibition of DKFZP434P211 (Accession NM_014549.1) . Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211.

[3006] FLJ20507 (Accession NM_017849.1) is another GAM38 target gene, herein designated TARGET GENE. FLJ20507 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE, designated SEQ ID:1188, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3007] Another function of GAM38 is therefore inhibition of

FLJ20507 (Accession NM_017849.1) . Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507.

[3008] LOC151720 (Accession XM_087279.6) is another GAM38 target gene, herein designated TARGET GENE. LOC151720 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151720, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151720 BINDING SITE, designated SEQ ID:3460, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3009] Another function of GAM38 is therefore inhibition of LOC151720 (Accession XM_087279.6) . Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151720.

[3010] LOC254848 (Accession XM_173133.4) is another GAM38 target gene, herein designated TARGET GENE. LOC254848 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254848, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254848 BINDING SITE, designated SEQ ID:19887, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3011] Another function of GAM38 is therefore inhibition of LOC254848 (Accession XM_173133.4) . Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254848.

[3012] LOC255975 (Accession XM_171083.2) is another GAM38 target gene, herein designated TARGET GENE. LOC255975 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:20152, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3013] Another function of GAM38 is therefore inhibition of LOC255975 (Accession XM_171083.2) . Accordingly, utilities of GAM38 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC255975.

[3014] MAAT1 (Accession) is another GAM38 target gene, herein designated TARGET GENE. MAAT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAAT1 BINDING SITE, designated SEQ ID:18969, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3015] Another function of GAM38 is therefore inhibition of MAAT1 (Accession) . Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAAT1.

[3016] Microtubule-associated protein 1b (MAP1B, Accession NM_005909.2) is another GAM38 target gene, herein designated TARGET GENE. MAP1B BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAP1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MAP1B BINDING SITE, designated SEQ ID:6168, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3017] Another function of GAM38 is therefore inhibition of Microtubule-associated protein 1b (MAP1B, Accession NM_005909.2), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B.

[3018] The function of MAP1B has been established by previous studies. Using a polyclonal antiserum directed against the C- terminal domain of dystrophin, Lien et al. (1991) isolated a cDNA clone encoding an antigenically crossreactive protein, microtubule- associated protein 1B (MAP1B). By in situ hybridization, the gene was mapped to 5q13 in proximity to the spinal muscular atrophy (SMA; 253300) locus. Genetic linkage analysis of SMA families using a human dinucleotide repeat polymorphism just 3- prime of the MAP1B gene has shown tight linkage to SMA mutations. These mapping data, together with the postulated role of MAP1B in neuronal morphogenesis and its localization in anterior horn motor neurons, suggest a possible association with SMA. The maximum lod score between SMA and

MAP1B for combined sexes was 20.24 at a recombination fraction of 0.02. The 2 recombinants between MAP1B and SMA might appear to eliminate the possibility of an etiologic relationship between MAP1B and SMA. However, there is likely to be nonallelic heterogeneity, particularly among chronic cases of SMA. If MAP1B were indeed the SMA locus, it would be expected to be recombinant in families that have mutations at another locus. MAP1B was found to be the closest marker distal to the locus for SMA; its 5- prime end was oriented toward the centromere (Wirth et al., 1993). Hammarback et al. (1991) found that LC1, one of the 3 light chains that makes up the MAP1B complex, is encoded within the 3- prime end of the MAP1B heavy chain gene. Their data suggested that the heavy chain and light chain 1 are produced by proteolytic processing of a precursor polypeptide. Lien et al. (1994) completely cloned and sequenced the human MAP1B gene. The expressed protein showed 91% overall identity with rat and mouse MAP1B. The gene has 7 exons; the third exon contains sequence not represented in mouse or rat MAP1B. This sequence, labeled 3A, is present at the 5-prime end of an alternative transcript that is expressed at approximately one- tenth the level of the full- length

transcript. Neuronal microtubules are considered to have a role in dendrite and axon formation. Different portions of the developing and adult brain microtubules are associated with different microtubule- associated proteins. MAP1B is expressed in different portions of the brain and may have a role in neuronal plasticity and brain development. Edelmann et al. (1996) generated mice that carry an insertion in MAP1B by gene- targeting methods. Mice homozygous for the modification died during embryogenesis. The heterozygotes exhibited a spectrum of phenotypes including slower growth rates, lack of visual acuity in one or both eyes, and motor system abnormalities. Histochemical analysis of the severely affected mice revealed that their Purkinje cell dendritic processes were abnormal, did not react with MAP1B antibodies, and showed reduced staining with MAP1A (OMIM Ref. No. 600178) antibodies. Similar histologic and immunochemical changes were observed in the olfactory bulb, hippocampus, and retina, providing a basis for the observed phenotypes

[3019]

[3022] Edelmann, W.; Zervas, M.; Costello, P.; Roback. L.; Fischer, I.; Hammarback, J. A.; Cowan, N.; Davies, P.; Wainer, B.; Kucherlapati, R. : Neuronal abnormalities in microtubule-associated pr.

[3023] Further studies establishing the function and utilities of MAP1B are found in John Hopkins OMIM database record ID 157129, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC21688 (Accession NM_144635.1) is another GAM38 target gene, herein designated TARGET GENE. MGC21688 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC21688, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC21688 BINDING SITE, designated SEQ ID:6874, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3024] Another function of GAM38 is therefore inhibition of

MGC21688 (Accession NM_144635.1) . Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21688.

[3025] Procollagen (type iii) n-endopeptidase (PCOLN3, Accession NM_002768.1) is another GAM38 target gene, herein designated TARGET GENE. PCOLN3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCOLN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCOLN3 BINDING SITE, designated SEQ ID:14968, to the nucleotide sequence of GAM38 RNA, herein designated GAM RNA, also designated SEQ ID:271.

[3026] Another function of GAM38 is therefore inhibition of Procollagen (type iii) n-endopeptidase (PCOLN3, Accession NM_002768.1), a gene which is a member of the zincin superfamily of zinc- dependent metalloproteases. Accordingly, utilities of GAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCOLN3.

[3027] The function of PCOLN3 has been established by previous

studies. Metallopeptidases are a functionally diverse group of enzymes that are involved in critical stages of many biologic processes including bacterial pathogenesis, growth factor activation, and cancer metastasis. They are essential for the synthesis of the collagen that forms the fibrous scaffold of the extracellular matrix of tissues. Most metallopeptidases contain a zinc cation necessary for both structure coordination of the active site and catalysis. The zincin superfamily comprises metallopeptidases that contain the HEXXH zinc- binding consensus sequence. The 2 histidine residues serve as zinc ligands, and the glutamic acid residue polarizes a water molecule involved in the nucleophilic attack of peptide bonds. Subclassification is based on the identity of other amino acids that act as zinc ligands. Gluzincins, for example, have glutamic acid as a third zinc ligand. Halila et al. (1989) isolated a possible cDNA for type III procollagen N- proteinase (OMIM Ref. No. PCOLN3) from a human placenta cDNA library. By screening a human placenta cDNA library with polyclonal antibodies raised against human PCOLN3 and the use of 5- prime RACE and primer extension strategies on the isolated cDNAs, Scott et al. (1996) identified a gene, which they symbolized PRSM1, that is a

member of the gluzincin subfamily of metallopeptidases. The full- length composite sequence of the PRSM1 gene encodes a deduced 318- amino acid protein with an HELGH pentapeptide fitting the consensus sequence characteristic of zincins, and a glutamic acid 25 residues C-terminal of the first histidine, fitting the pattern of gluzincins for a third zinc- binding ligand. PRSM1 contains 3 clusters of cysteine residues: 1 cluster of 4 residues and 1 cluster of 6 residues at the N terminus and a cluster of 6 residues at the C terminus. However, the predicted sequence lacks potential glycosylation sites. Immunoblot analysis of placental tissue revealed an approximately 30-kD protein. Northern blot analysis of human fibroblast culture mRNA detected a transcript of approximately 2.5 kb. By Northern blot analysis, Nomura et al. (1994) found that PRSM1, which they designated KIAA0047, is expressed ubiquitously, with highest levels in lung and kidney as well as in HeLa and KG- 1 cell lines.

[3028]

[3029] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3032] Further studies establishing the function and utilities of PCOLN3 are found in John Hopkins OMIM database record ID 164010, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[3033] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 39 (GAM39), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[3034] GAM39 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM39 was detected is described hereinabove with reference to Figs. 8-15.

[3035] GAM39 gene, herein designated GAM GENE, and GAM39 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[3036] GAM39 gene encodes a GAM39 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM39 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM39 precursor RNA is designated SEQ ID:27, and is provided hereinbelow with reference to the sequence listing part.

[3037] GAM39 precursor RNA folds onto itself, forming GAM39 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3038] GAM39 precursor RNA folds onto itself, forming GAM39 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[3039] Nucleotide sequence of GAM39 precursor RNA, designated SEQ-ID: 27, and a schematic representation of a predicted secondary folding of GAM39 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[3040] An enzyme complex designated DICER COMPLEX, `dices` the GAM39 folded precursor RNA into GAM39 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM39 RNA is designated SEQ ID:386, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[3041] GAM39 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM39 target RNA, herein designated GAM TARGET RNA. GAM39 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3042] GAM39 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM39 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM39 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM39 RNA may have a different number of target binding sites in untranslated regions of a GAM39 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3043] The complementary binding of GAM39 RNA, herein designated GAM RNA, to target binding sites on GAM39 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM39 target RNA into GAM39 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[3044] It is appreciated that GAM39 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM39 target genes. The mRNA of each one of this plurality of GAM39 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM39 RNA, herein designated GAM RNA, and which when bound by GAM39 RNA causes inhibition of translation of respective one or more GAM39 target proteins.

[3045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM39 gene, herein designated GAM GENE, on one or

more GAM39 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3046] It is appreciated that specific functions and accordingly utilities of GAM39 correlate with, and may be deduced from, the identity of the target genes which GAM39 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3047]

[3048]

[3049] Chromosome 20 open reading frame 177 (C20orf177, Accession XM_290955.1) is a GAM39 target gene, herein designated TARGET GENE. C20orf177 BINDING SITE is a

target binding site found in the 3` untranslated region of mRNA encoded by C20orf177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf177 BINDING SITE, designated SEQ ID:13958, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3050] A function of GAM39 is therefore inhibition of Chromosome 20 open reading frame 177 (C20orf177, Accession XM_290955.1) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf177.

[3051] Cholinergic receptor, nicotinic, alpha polypeptide 10 (CHRNA10, Accession NM_020402.2) is another GAM39 target gene, herein designated TARGET GENE. CHRNA10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHRNA10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRNA10 BINDING SITE, designated SEQ ID:3642, to the nucleotide sequence of GAM39 RNA, herein designated

GAM RNA, also designated SEQ ID:386.

[3052] Another function of GAM39 is therefore inhibition of Cholinergic receptor, nicotinic, alpha polypeptide 10 (CHRNA10, Accession NM_020402.2) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA10.

[3053] Dehydrogenase/reductase (sdr family) member 2 (DHRS2, Accession NM_005794.1) is another GAM39 target gene, herein designated TARGET GENE. DHRS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHRS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHRS2 BINDING SITE, designated SEQ ID:1429, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3054] Another function of GAM39 is therefore inhibition of Dehydrogenase/reductase (sdr family) member 2 (DHRS2, Accession NM_005794.1) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHRS2.

[3055] FLJ23476 (Accession NM_024640.1) is another GAM39 target gene, herein designated TARGET GENE. FLJ23476 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23476, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23476 BINDING SITE, designated SEQ ID:18143, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3056] Another function of GAM39 is therefore inhibition of FLJ23476 (Accession NM_024640.1) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23476.

[3057] KIAA1924 (Accession NM_153239.2) is another GAM39 target gene, herein designated TARGET GENE. KIAA1924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:17872, to the nucleotide sequence of GAM39 RNA, herein designated

GAM RNA, also designated SEQ ID:386.

[3058] Another function of GAM39 is therefore inhibition of KIAA1924 (Accession NM_153239.2) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924.

[3059] LOC51161 (Accession NM_016210.1) is another GAM39 target gene, herein designated TARGET GENE. LOC51161 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC51161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51161 BINDING SITE, designated SEQ ID:15881, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3060] Another function of GAM39 is therefore inhibition of LOC51161 (Accession NM_016210.1) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51161.

[3061] LOC91040 (Accession) is another GAM39 target gene, herein designated TARGET GENE. LOC91040 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91040, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:18287, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3062] Another function of GAM39 is therefore inhibition of LOC91040 (Accession) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040.

[3063] MGC10701 (Accession NM_032658.1) is another GAM39 target gene, herein designated TARGET GENE. MGC10701 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC10701, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10701 BINDING SITE, designated SEQ ID:19440, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3064] Another function of GAM39 is therefore inhibition of

MGC10701 (Accession NM_032658.1) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10701.

[3065] MGC11335 (Accession NM_030819.2) is another GAM39 target gene, herein designated TARGET GENE. MGC11335 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11335, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11335 BINDING SITE, designated SEQ ID:15461, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3066] Another function of GAM39 is therefore inhibition of MGC11335 (Accession NM_030819.2) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11335.

[3067] Rad1 homolog (s. pombe) (RAD1, Accession NM_133377.1) is another GAM39 target gene, herein designated TARGET GENE. RAD1 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by RAD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD1 BINDING SITE, designated SEQ ID:16511, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3068] Another function of GAM39 is therefore inhibition of Rad1 homolog (s. pombe) (RAD1, Accession NM_133377.1), a gene which has important roles in DNA damage- activated mitotic and meiotic cell cycle checkpoints. Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD1.

[3069] The function of RAD1 has been established by previous studies. In the fission yeast S. pombe, the rad1+ gene product is required for DNA repair and replication. Parker et al. (1998) cloned 2 alternatively spliced human cDNAs encoding proteins with significant homology to yeast rad1+. The longer cDNA, called Hrad1A, encodes a 282-amino acid polypeptide, while Hrad1B encodes a 163-amino acid polypeptide. Northern blot analysis revealed that human RAD1 is expressed as mRNAs of 5, 3, and 1.3

kb in a variety of human tissues, with higher levels present in some cancer cell lines. Northern blot analysis of cells subjected to ultraviolet radiation demonstrated that human RAD1 expression is not induced in response to DNA damage. Purified RAD1 exhibited terminal exonuclease activity on double- stranded DNA, with a preference for 3- prime ends. Independently, Udell et al. (1998) isolated RAD1 cDNAs from a spontaneously transformed human keratinocyte cDNA library. The cDNAs encode the 282- amino acid RAD1 isoform, which is 90% and 27% identical to mouse Rad1 and S. pombe rad1+, respectively. Udell et al. (1998) found that expression of human RAD1 in yeast rad1 mutants partially restores radiation resistance and G2 checkpoint proficiency.

[3070]

[3071] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3072] Parker, A. E.; Van de Weyer, I.; Laus, M. C.; Oostveen, I.; Yon, J.; Verhasselt, P.; Luyten, W. H. M. L. : A human homologue of Schizosaccharomyces pombe rad1+ checkpoint gene encodes an exonuclease. J. Biol. Chem. 273: 18332- 18339, 1998. ; and

[3074] Further studies establishing the function and utilities of RAD1 are found in John Hopkins OMIM database record ID 603153, and in cited publications listed in Table 5, which are hereby incorporated by reference.Small nuclear rna activating complex, polypeptide 4, 190kda (SNAPC4, Accession NM_003086.1) is another GAM39 target gene, herein designated TARGET GENE. SNAPC4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SNAPC4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAPC4 BINDING SITE, designated SEQ ID:8252, to the nucleotide sequence of GAM39 RNA, herein designated GAM RNA, also designated SEQ ID:386.

[3075] Another function of GAM39 is therefore inhibition of Small nuclear rna activating complex, polypeptide 4, 190kda (SNAPC4, Accession NM_003086.1) . Accordingly, utilities of GAM39 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SNAPC4.

[3076]

[3077] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 40 (GAM40), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[3078] GAM40 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM40 was detected is described hereinabove with reference to Figs. 8-15.

[3079] GAM40 gene, herein designated GAM GENE, and GAM40 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[3080] GAM40 gene encodes a GAM40 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM40 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM40 precursor RNA is designated SEQ ID:126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:126 is located at position 72533165 relative to chromosome 10.

[3081] GAM40 precursor RNA folds onto itself, forming GAM40 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3082] GAM40 precursor RNA folds onto itself, forming GAM40 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[3083] Nucleotide sequence of GAM40 precursor RNA, designated SEQ-ID: 126, and a schematic representation of a predicted secondary folding of GAM40 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[3084] An enzyme complex designated DICER COMPLEX, `dices` the GAM40 folded precursor RNA into GAM40 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary

proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM40 RNA is designated SEQ ID:396, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[3085] GAM40 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM40 target RNA, herein designated GAM TARGET RNA. GAM40 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3086] GAM40 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM40 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM40 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is

meant as an illustration only, and is not meant to be limiting GAM40 RNA may have a different number of target binding sites in untranslated regions of a GAM40 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3087] The complementary binding of GAM40 RNA, herein designated GAM RNA, to target binding sites on GAM40 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM40 target RNA into GAM40 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[3088] It is appreciated that GAM40 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM40 target genes. The mRNA of each one of this plurality of GAM40 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM40 RNA, herein designated GAM RNA, and which when bound by GAM40 RNA causes inhibition of translation of respective

one or more GAM40 target proteins.

[3089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM40 gene, herein designated GAM GENE, on one or more GAM40 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3090] It is appreciated that specific functions and accordingly utilities of GAM40 correlate with, and may be deduced from, the identity of the target genes which GAM40 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3091]

[3092]

[3093] Atp-binding cassette, sub-family a (abc1), member 9 (ABCA9, Accession NP_759018.1) is a GAM40 target gene, herein designated TARGET GENE. ABCA9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ABCA9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCA9 BINDING SITE, designated SEQ ID:10551, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3094] A function of GAM40 is therefore inhibition of Atp-binding cassette, sub-family a (abc1), member 9 (ABCA9, Accession NP_759018.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA9.

[3095] Atp-binding cassette, sub-family a (abc1), member 9 (ABCA9, Accession NP_525022.2) is another GAM40 target gene, herein designated TARGET GENE. ABCA9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ABCA9, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCA9 BINDING SITE, designated SEQ ID:10551, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3096] Another function of GAM40 is therefore inhibition of Atp-binding cassette, sub-family a (abc1), member 9 (ABCA9, Accession NP_525022.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA9.

[3097] Actin, gamma 2, smooth muscle, enteric (ACTG2, Accession NP_001606.1) is another GAM40 target gene, herein designated TARGET GENE. ACTG2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ACTG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACTG2 BINDING SITE, designated SEQ ID:465, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3098] Another function of GAM40 is therefore inhibition of Actin, gamma 2, smooth muscle, enteric (ACTG2, Accession NP_001606.1), a gene which are involved in various

types of cell motility and are ubiquitously expressed in all eukaryotic cells. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTG2.

[3099] The function of ACTG2 has been established by previous studies. Miwa et al. (1991) isolated recombinant phages that carried the human smooth muscle (enteric) gamma-actin gene (which they symbolized ACTSG) from human genomic DNA libraries. The gene, designated ACTG2, contained one 5- prime untranslated exon and 8 coding exons extending for 27 kb; the mapping of the gene to chromosome 2 was demonstrated by study of rodent- human somatic cell hybrids. Ueyama et al. (1995) isolated genomic clones containing the gene (which has also been symbolized ACTA3) and mapped the gene to 2p13.1 by fluorescence in situ hybridization. From the characterized molecular structures of the 6 human actin isoform genes, Miwa et al. (1991) proposed a hypothesis of the evolutionary pathway of the actin gene family. Each of the 5 other actin genes maps to a separate chromosome. Ueyama et al. (1995) demonstrated that the HindIII RFLP in the first intron of the gene is due to the presence/absence of a 24- bp sequence harboring a HindIII restriction site. A

biallelic system was found to have allelic frequencies of 45 (HindIII- minus):55 (HindIII- Plus).

[3100]

[3101] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3102] Miwa, T.; Manabe, Y.; Kurokawa, K.; Kamada, S.; Kanda, N.; Bruns, G.; Ueyama, H.; Kakunaga, T. : Structure, chromosome location, and expression of the human smooth muscle (enteric type) gamma- actin gene: evolution of six human actin genes. Molec. Cell. Biol. 11: 3296- 3306, 1991. ; and

[3103] Ueyama, H.; Inazawa, J.; Nishino, H.; Han- Xiang, D.; Ochiai, Y.; Ohkubo, I. : Chromosomal mapping of the human smooth muscle actin gene (enteric type, ACTA3) to 2p13.1 and molecular natur.

[3104] Further studies establishing the function and utilities of ACTG2 are found in John Hopkins OMIM database record ID 102545, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adp-ribosyltransferase (nad+; poly (adp-ribose) polymerase)-like 3 (ADPRTL3, Accession NP_005476.1) is another GAM40 target gene, herein designated TARGET

GENE. ADPRTL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADPRTL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADPRTL3 BINDING SITE, designated SEQ ID:2591, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3105] Another function of GAM40 is therefore inhibition of Adp-ribosyltransferase (nad+; poly (adp-ribose) polymerase)-like 3 (ADPRTL3, Accession NP_005476.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADPRTL3.

[3106] Adenylate kinase 5 (AK5, Accession NP_777283.1) is another GAM40 target gene, herein designated TARGET GENE. AK5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AK5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AK5 BINDING SITE, designated SEQ ID:6701, to the nucleotide sequence of GAM40

RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3107] Another function of GAM40 is therefore inhibition of Adenylate kinase 5 (AK5, Accession NP_777283.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK5.

[3108] Adenylate kinase 5 (AK5, Accession NP_036225.2) is another GAM40 target gene, herein designated TARGET GENE. AK5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AK5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AK5 BINDING SITE, designated SEQ ID:6701, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3109] Another function of GAM40 is therefore inhibition of Adenylate kinase 5 (AK5, Accession NP_036225.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK5.

[3110] Amelogenin (x chromosome, amelogenesis imperfecta 1) (AMELX, Accession NP_001133.1) is another GAM40 target gene, herein designated TARGET GENE. AMELX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AMELX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMELX BINDING SITE, designated SEQ ID:5458, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3111] Another function of GAM40 is therefore inhibition of Amelogenin (x chromosome, amelogenesis imperfecta 1) (AMELX, Accession NP_001133.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMELX.

[3112] Basic, immunoglobulin-like variable motif containing (BIVM, Accession NP_060163.2) is another GAM40 target gene, herein designated TARGET GENE. BIVM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BIVM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of BIVM BINDING SITE, designated SEQ ID:10429, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3113] Another function of GAM40 is therefore inhibition of Basic, immunoglobulin-like variable motif containing (BIVM, Accession NP_060163.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIVM.

[3114] C14orf45 (Accession NP_079333.1) is another GAM40 target gene, herein designated TARGET GENE. C14orf45 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf45, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf45 BINDING SITE, designated SEQ ID:7225, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3115] Another function of GAM40 is therefore inhibition of C14orf45 (Accession NP_079333.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf45.

[3116] Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NP_001223.1) is another GAM40 target gene, herein designated TARGET GENE. CASQ2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CASQ2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASQ2 BINDING SITE, designated SEQ ID:14756, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3117] Another function of GAM40 is therefore inhibition of Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NP_001223.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASQ2.

[3118] CDK11 (Accession XP_166324.1) is another GAM40 target gene, herein designated TARGET GENE. CDK11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDK11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDK11 BINDING SITE, designated

SEQ ID:2021, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3119] Another function of GAM40 is therefore inhibition of CDK11 (Accession XP_166324.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK11.

[3120] CGI-01 (Accession NP_057019.2) is another GAM40 target gene, herein designated TARGET GENE. CGI-01 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CGI-01, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-01 BINDING SITE, designated SEQ ID:18067, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3121] Another function of GAM40 is therefore inhibition of CGI-01 (Accession NP_057019.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-01.

[3122] Chloride channel 6 (CLCN6, Accession NP_068504.1) is another GAM40 target gene, herein designated TARGET GENE. CLCN6 BINDING SITE is a target binding site found

in the 3` untranslated region of multiple transcripts of mRNA encoded by CLCN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE, designated SEQ ID:2020, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3123] Another function of GAM40 is therefore inhibition of Chloride channel 6 (CLCN6, Accession NP_068504.1), a gene which is a voltage- gated chloride channel. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6.

[3124] The function of CLCN6 has been established by previous studies. Members of the mammalian CLCN family of voltage- gated chloride channels display differential tissue distribution and perform diverse functions. Nomura et al. (1994) identified a partial human CLCN6 cDNA, which they called KIAA0046. Northern blot analysis revealed that CLCN6 was expressed widely. Using the partial cDNA sequence of Nomura et al. (1994), Brandt and Jentsch (1995) cloned human cerebral cortex cDNAs that covered the en-

tire CLCN6 coding region. The predicted 869- amino acid protein was called CLC6 by them. The amino acid sequence of CLCN6 is 45% identical to that of CLCN7 (OMIM Ref. No. 602727) but only 23 to 29% identical to the sequences of other known CLCNs. Therefore, Brandt and Jentsch (1995) stated that CLCN6 and CLCN7 together define a new branch of the chloride channel protein family. By Northern blot analysis, Brandt and Jentsch (1995) found that CLCN6 was expressed as an approximately 6- kb mRNA in all tissues examined. Eggermont et al. (1997) identified 4 different CLCN6 cDNAs that represent alternatively spliced transcripts. Nomura et al. (1994) mapped the CLCN6 gene to chromosome 1 using a somatic cell hybrid panel. By fluorescence in situ hybridization, Brandt and Jentsch (1995) refined the localization of the CLCN6 gene to 1p36. They noted that 2 genes encoding kidney-specific chloride channels, CLCNKA (OMIM Ref. No. 602024) and CLCNKB (OMIM Ref. No. 602023), also map to 1p36.

[3125]

[3126] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3127] REFERENCES 1. Brandt, S.; Jentsch, T. J. : ClC- 6 and ClC- 7 are two novel broadly expressed members of the CLC chloride channel family. FEBS Lett. 377: 15- 20, 1995. ; and

to 1p36.

[3139]

[3140] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3141] REFERENCES 1. Brandt, S.; Jentsch, T. J. : ClC- 6 and ClC- 7 are two novel broadly expressed members of the CLC chloride channel family. FEBS Lett. 377: 15- 20, 1995. ; and

[3142] Eggermont, J.; Buyse, G.; Voets, T.; Tytgat, J.; De Smedt, H.; Droogmans, G. : Alternative splicing of ClC- 6 (a member of the ClC chloride- channel family) transcripts generates three tr.

[3143] Further studies establishing the function and utilities of CLCN6 are found in John Hopkins OMIM database record ID 602726, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chloride channel 6 (CLCN6, Accession NP_068505.1) is another GAM40 target gene, herein designated TARGET GENE. CLCN6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLCN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE, designated SEQ ID:2020, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3144] Another function of GAM40 is therefore inhibition of Chloride channel 6 (CLCN6, Accession NP_068505.1), a gene which is a voltage- gated chloride channel. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6.

[3145] The function of CLCN6 has been established by previous studies. Members of the mammalian CLCN family of voltage- gated chloride channels display differential tissue distribution and perform diverse functions. Nomura et al. (1994) identified a partial human CLCN6 cDNA, which they called KIAA0046. Northern blot analysis revealed that CLCN6 was expressed widely. Using the partial cDNA sequence of Nomura et al. (1994), Brandt and Jentsch (1995) cloned human cerebral cortex cDNAs that covered the entire CLCN6 coding region. The predicted 869- amino acid protein was called CLC6 by them. The amino acid sequence of CLCN6 is 45% identical to that of CLCN7 (OMIM Ref. No. 602727) but only 23 to 29% identical to the se-

quences of other known CLCNs. Therefore, Brandt and Jentsch (1995) stated that CLCN6 and CLCN7 together define a new branch of the chloride channel protein family. By Northern blot analysis, Brandt and Jentsch (1995) found that CLCN6 was expressed as an approximately 6- kb mRNA in all tissues examined. Eggermont et al. (1997) identified 4 different CLCN6 cDNAs that represent alternatively spliced transcripts. Nomura et al. (1994) mapped the CLCN6 gene to chromosome 1 using a somatic cell hybrid panel. By fluorescence in situ hybridization, Brandt and Jentsch (1995) refined the localization of the CLCN6 gene to 1p36. They noted that 2 genes encoding kidney-specific chloride channels, CLCNKA (OMIM Ref. No. 602024) and CLCNKB (OMIM Ref. No. 602023), also map to 1p36.

[3146]

[3147] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3150] Further studies establishing the function and utilities of CLCN6 are found in John Hopkins OMIM database record ID 602726, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-x-c motif) receptor 4 (CXCR4, Accession NP_003458.1) is another GAM40 target gene, herein designated TARGET GENE. CXCR4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCR4 BINDING SITE, designated SEQ ID:7288, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3151] Another function of GAM40 is therefore inhibition of Chemokine (c-x-c motif) receptor 4 (CXCR4, Accession NP_003458.1), a gene which mediates intracellular calcium flux. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with CXCR4.

[3152] The function of CXCR4 has been established by previous studies. Several receptors for neuropeptide Y (NPY; 162640) have been demonstrated and shown to differ in pharmacologic characteristics, tissue distribution, and structure of the encoding genes; see the NPY Y1 receptor (NPY1R; 162641) and the NPY Y2 receptor (NPY2R; 162642). Herzog et al. (1993) cloned, sequenced, and mapped the human homolog of a proposed bovine NPY Y3 receptor reported by Rimland et al. (1991). The human cDNA clone was derived from a human lung cDNA library. The 1,670- bp sequence predicts a single open reading frame (ORF) of 352 amino acids, with 92% amino acid identity to the reported bovine sequence. The amino acid sequence shares features common to many other G protein- coupled receptors, including the 7- transmembrane regions and putative glycosylation and phosphorylation sites. The receptor shows 36% identity to the interleukin-8 receptor (IL8RA; 146929), which is located on chromosome 2, and to the angiotensin II receptor (AGTR1; 106165), but only 21% identity to the NPY Y1 receptor. Furthermore, Herzog et al. (1993) reported that NPY and a number of other ligands failed to induce any change in

cytosolic calcium levels in transfected cells, suggesting that this clone represented a novel neuropeptide receptor. By PCR analysis of human/hamster hybrid cell DNA they showed that the NPY3R gene is located on human chromosome 2. Jazin et al. (1993) independently found that the Y3 receptor does not respond to NPY. The recruitment of leukocytes to inflamed tissues involves interleukin- 8 (IL8; 146930) and several related chemotactic cytokines that attract and activate leukocytes. Loetscher et al. (1994) noted that these proteins are similar in size, have marked sequence similarities, and are characterized by 4 conserved cysteines that form 2 essential disulfide bonds. Two subfamilies are distinguished according to the arrangement of the first 2 cysteines, which are either adjacent (CC subfamily) or separated by one amino acid (CXC subfamily). The CXC cytokines activate primarily neutrophil leukocytes, while CC cytokines act on monocytes, basophils, and eosinophils. These chemotactic agonists act via 7- transmembrane domain, G protein- coupled receptors, e.g., the 2 interleukin- 8 receptors, IL8RA and IL8RB (OMIM Ref. No. 146928). Chemotactic cytokines of the CC subfamily do not bind to IL8 receptors. Loetscher et al. (1994) isolated from a human blood monocyte cDNA

library a cDNA clone encoding a protein of 352 amino acids, corresponding to a receptor of the 7- transmembrane domain, G protein- coupled type. They referred to the gene and the deduced protein as LESTR for 'leukocyte-derived seven- transmembrane domain receptor.' It shows 92.6% identity with a bovine neuropeptide Y receptor. In the monocyte library, LESTR cDNA fragments were about 20 times as frequent as cDNA coding for IL8RA and IL8RB, and much higher levels of mRNA specific for LESTR than for IL8R were found in human blood neutrophils and lymphocytes. Although the ligand for LESTR could not be identified among a large number of chemotactic cytokines, the high expression in white blood cells and the marked sequence relation to IL8RA and IL8RB suggested to Loetscher et al. (1994) that LESTR may function in the activation of inflammatory cells. CXCR4 mRNA is expressed at sites of neuronal and progenitor cell migration in the hippocampus at late embryonic and early postnatal ages. SDF1 mRNA, the only known ligand for the CXCR4 receptor, is expressed close to these migration sites, in the meninges investing the hippocampal primordium and in the primordium itself. In mice engineered to lack the CXCR4 receptor, Lu et al. (2002) found that the morphol-

ogy of the hippocampal dentate gyrus was dramatically altered. Gene expression markers for dentate gyrus granule neurons and bromodeoxyuridine labeling of dividing cells showed an underlying defect in the stream of postmitotic cells and secondary dentate progenitor cells that migrate toward and form the dentate gyrus. In the absence of CXCR4, the number of dividing cells in the migratory stream and in the dentate gyrus itself was reduced, and neurons appeared to differentiate prematurely before reaching their target. Thus, Lu et al. (2002) concluded that the SDF1/CXCR4 chemokine signaling system has a role in dentate gyrus morphogenesis. The dentate gyrus is unusual as a site of adult neurogenesis. They found that both CXCR4 and SDF1 are expressed in the adult dentate gyrus, suggesting an ongoing role in dentate gyrus morphogenesis

[3157] Further studies establishing the function and utilities of CXCR4 are found in John Hopkins OMIM database record ID 162643, and in cited publications listed in Table 5, which are hereby incorporated by reference.CYP19A1 (Accession NP_000094.2) is another GAM40 target gene, herein designated TARGET GENE. CYP19A1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CYP19A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP19A1 BINDING SITE, designated SEQ ID:20107, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3158] Another function of GAM40 is therefore inhibition of CYP19A1 (Accession NP_000094.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19A1.

[3159] CYP19A1 (Accession NP_112503.1) is another GAM40 target gene, herein designated TARGET GENE. CYP19A1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CYP19A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP19A1 BINDING SITE, designated SEQ ID:20107, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3160] Another function of GAM40 is therefore inhibition of CYP19A1 (Accession NP_112503.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19A1.

[3161] DKFZp547G183 (Accession NP_061175.1) is another GAM40 target gene, herein designated TARGET GENE. DKFZp547G183 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547G183, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547G183 BINDING SITE, designated SEQ ID:18002, to the nucleotide sequence of

GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3162] Another function of GAM40 is therefore inhibition of DKFZp547G183 (Accession NP_061175.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547G183.

[3163] Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004004.1) is another GAM40 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:16644, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3164] Another function of GAM40 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004004.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystro-

phy. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[3165] The function of DMD has been established by previous studies. Roberts et al. (1992) described a general approach to the identification of the basic defect in the one-third of DMD patients who do not show a gross rearrangement of the dystrophin gene. The method involved nested amplification, chemical mismatched detection, and sequencing of reverse transcripts of trace amounts of dystrophin mRNA from peripheral blood lymphocytes. Analysis of the entire coding region (11 kb) in 7 patients resulted in detection of a sequence change in each case that was clearly sufficient to cause the disease. All the mutations were expected to cause premature translation termination, and the resulting phenotypes were thus equivalent to those caused by frameshifting deletions; see 300377.0003- 300377.0009. Deletions and point mutations in the DMD gene cause either DMD or the milder Becker muscular dystrophy, depending on whether the translational reading frame is lost or maintained. De Angelis et al. (2002) reasoned that because internal in-

frame deletions in the protein produce only mild myopathic symptoms, a partially corrected phenotype could be restored by preventing the inclusion of specific mutated exons in the mature dystrophin mRNA. Such control had previously been accomplished by the use of synthetic oligonucleotides. To circumvent the disadvantageous necessity for periodic administration of the synthetic oligonucleotides, De Angelis et al. (2002) produced several constructs able to express in vivo, in a stable fashion, large amounts of chimeric RNAs containing antisense sequences. They showed that antisense molecules against exon 51 splice junctions were able to direct skipping of that exon in the human DMD deletion 48- 50 and to rescue dystrophin synthesis. They also showed that the highest skipping activity occurred when antisense constructs against the 5- prime and 3- prime splice sites were coexpressed in the same cell. The effects were tested in cultured myoblasts from a DMD patient. The deletion of exons 48- 50 resulted in a premature termination codon in exon 51. The antisense sequences complementary to exon 51 splice junctions induced efficient skipping of exon 51 and partial rescue of dystrophin synthesis. X-linked dilated cardiomyopathy is a dystrophinopathy char-

acterized by severe cardiomyopathy with no skeletal muscle involvement. Several XLCM patients have been described with mutations that abolish dystrophin muscle isoform expression, but with increased expression of brain and cerebellar Purkinje isoforms of the gene exclusively in the skeletal muscle. Bastianutto et al. (2001) determined that 2 XLCM patients bore deletions that removed the muscle promoter and exon 1, but not the brain and cerebellar Purkinje promoters. The brain and cerebellar Purkinje promoters were found to be essentially inactive in muscle cell lines and primary cultures. Since dystrophin muscle enhancer 1 (DME1), a muscle- specific enhancer, is preserved in these patients, the authors tested its ability to upregulate the brain and cerebellar Purkinje promoters in muscle cells. Brain and cerebellar Purkinje promoter activity was significantly increased in the presence of DME1, and activation was observed exclusively in cells presenting a skeletal muscle phenotype versus cardiomyocytes. The authors suggested a role for DME1 in the induction of brain and cerebellar Purkinje isoform expression in the skeletal muscle of XLCM patients defective for muscle isoform expression.

[3166] Animal model experiments lend further support to the

function of DMD. Using DNA microarray, Porter et al. (2002) established a molecular signature of dystrophinopathy in the mdx mouse. In leg muscle, 242 differentially expressed genes were identified. Data provided evidence for coordinated activity of numerous components of a chronic inflammatory response, including cytokine and chemokine signaling, leukocyte adhesion and diapedesis, invasive cell type- specific markers, and complement system activation. Upregulation of secreted phosphoprotein 1 (SPP1; 166490) mRNA and protein in dystrophic muscle identified a novel linkage between inflammatory cells and repair processes. Extracellular matrix genes were upregulated in mdx to levels similar to those in DMD. Since, unlike DMD, mdx exhibits little fibrosis, data suggested that collagen regulation at post-transcriptional stages may mediate extensive fibrosis in DMD.

[3167] It is appreciated that the abovementioned animal model for DMD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3187] Further studies establishing the function and utilities of DMD are found in John Hopkins OMIM database record ID 300377, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004011.1) is another GAM40 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:16644, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3188] Another function of GAM40 is therefore inhibition of Dys-

trophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004011.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[3189] The function of DMD has been established by previous studies. Roberts et al. (1992) described a general approach to the identification of the basic defect in the one-third of DMD patients who do not show a gross rearrangement of the dystrophin gene. The method involved nested amplification, chemical mismatched detection, and sequencing of reverse transcripts of trace amounts of dystrophin mRNA from peripheral blood lymphocytes. Analysis of the entire coding region (11 kb) in 7 patients resulted in detection of a sequence change in each case that was clearly sufficient to cause the disease. All the mutations were expected to cause premature translation termination, and the resulting phenotypes were thus equivalent to those caused by frameshifting deletions; see 300377.0003- 300377.0009. Deletions and point muta-

tions in the DMD gene cause either DMD or the milder Becker muscular dystrophy, depending on whether the translational reading frame is lost or maintained. De Angelis et al. (2002) reasoned that because internal in-frame deletions in the protein produce only mild myopathic symptoms, a partially corrected phenotype could be restored by preventing the inclusion of specific mutated exons in the mature dystrophin mRNA. Such control had previously been accomplished by the use of synthetic oligonucleotides. To circumvent the disadvantageous necessity for periodic administration of the synthetic oligonucleotides, De Angelis et al. (2002) produced several constructs able to express in vivo, in a stable fashion, large amounts of chimeric RNAs containing antisense sequences. They showed that antisense molecules against exon 51 splice junctions were able to direct skipping of that exon in the human DMD deletion 48- 50 and to rescue dystrophin synthesis. They also showed that the highest skipping activity occurred when antisense constructs against the 5- prime and 3- prime splice sites were coexpressed in the same cell. The effects were tested in cultured myoblasts from a DMD patient. The deletion of exons 48- 50 resulted in a premature termination codon in

exon 51. The antisense sequences complementary to exon 51 splice junctions induced efficient skipping of exon 51 and partial rescue of dystrophin synthesis. X-linked dilated cardiomyopathy is a dystrophinopathy characterized by severe cardiomyopathy with no skeletal muscle involvement. Several XLCM patients have been described with mutations that abolish dystrophin muscle isoform expression, but with increased expression of brain and cerebellar Purkinje isoforms of the gene exclusively in the skeletal muscle. Bastianutto et al. (2001) determined that 2 XLCM patients bore deletions that removed the muscle promoter and exon 1, but not the brain and cerebellar Purkinje promoters. The brain and cerebellar Purkinje promoters were found to be essentially inactive in muscle cell lines and primary cultures. Since dystrophin muscle enhancer 1 (DME1), a muscle- specific enhancer, is preserved in these patients, the authors tested its ability to upregulate the brain and cerebellar Purkinje promoters in muscle cells. Brain and cerebellar Purkinje promoter activity was significantly increased in the presence of DME1, and activation was observed exclusively in cells presenting a skeletal muscle phenotype versus cardiomyocytes. The authors suggested a role for DME1 in

the induction of brain and cerebellar Purkinje isoform expression in the skeletal muscle of XLCM patients defective for muscle isoform expression.

[3190] Animal model experiments lend further support to the function of DMD. Using DNA microarray, Porter et al. (2002) established a molecular signature of dystrophinopathy in the mdx mouse. In leg muscle, 242 differentially expressed genes were identified. Data provided evidence for coordinated activity of numerous components of a chronic inflammatory response, including cytokine and chemokine signaling, leukocyte adhesion and diapedesis, invasive cell type- specific markers, and complement system activation. Upregulation of secreted phosphoprotein 1 (SPP1; 166490) mRNA and protein in dystrophic muscle identified a novel linkage between inflammatory cells and repair processes. Extracellular matrix genes were upregulated in mdx to levels similar to those in DMD. Since, unlike DMD, mdx exhibits little fibrosis, data suggested that collagen regulation at post-transcriptional stages may mediate extensive fibrosis in DMD.

[3191] It is appreciated that the abovementioned animal model for DMD is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3192] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3193] De Angelis, F. G.; Sthandier, O.; Berarducci, B.; Toso, S.; Galluzzi, G.; Ricci, E.; Cossu, G.; Bozzoni, I. : Chimeric snRNA molecules carrying antisense sequences against the splice junctions of exon 51 of the dystrophin pre-mRNA induce exon skipping and restoration of a dystrophin synthesis in delta- 48- 50 DMD cells. Proc Nat. Acad. Sci. 99: 9456- 9461, 2002. ; and

[3194] Bastianutto, C.; Bestard, J. A.; Lahnakoski, K.; Broere, D.; De Visser, M.; Zaccolo, M.; Pozzan, T.; Ferlini, A.; Muntoni, F.; Patarnello, T.; Klamut, H. J. : Dystrophin muscle enhance.

[3195] Further studies establishing the function and utilities of DMD are found in John Hopkins OMIM database record ID 300377, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004012.1) is another GAM40 target gene, herein designated TARGET GENE. DMD BINDING SITE is a

target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:16644, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3196] Another function of GAM40 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004012.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[3197] The function of DMD has been established by previous studies. Roberts et al. (1992) described a general approach to the identification of the basic defect in the one-third of DMD patients who do not show a gross rearrangement of the dystrophin gene. The method involved nested amplification, chemical mismatched detection, and

sequencing of reverse transcripts of trace amounts of dystrophin mRNA from peripheral blood lymphocytes. Analysis of the entire coding region (11 kb) in 7 patients resulted in detection of a sequence change in each case that was clearly sufficient to cause the disease. All the mutations were expected to cause premature translation termination, and the resulting phenotypes were thus equivalent to those caused by frameshifting deletions; see 300377.0003- 300377.0009. Deletions and point mutations in the DMD gene cause either DMD or the milder Becker muscular dystrophy, depending on whether the translational reading frame is lost or maintained. De Angelis et al. (2002) reasoned that because internal in-frame deletions in the protein produce only mild myopathic symptoms, a partially corrected phenotype could be restored by preventing the inclusion of specific mutated exons in the mature dystrophin mRNA. Such control had previously been accomplished by the use of synthetic oligonucleotides. To circumvent the disadvantageous necessity for periodic administration of the synthetic oligonucleotides, De Angelis et al. (2002) produced several constructs able to express in vivo, in a stable fashion, large amounts of chimeric RNAs containing antisense se-

quences. They showed that antisense molecules against exon 51 splice junctions were able to direct skipping of that exon in the human DMD deletion 48- 50 and to rescue dystrophin synthesis. They also showed that the highest skipping activity occurred when antisense constructs against the 5- prime and 3- prime splice sites were coexpressed in the same cell. The effects were tested in cultured myoblasts from a DMD patient. The deletion of exons 48- 50 resulted in a premature termination codon in exon 51. The antisense sequences complementary to exon 51 splice junctions induced efficient skipping of exon 51 and partial rescue of dystrophin synthesis. X-linked dilated cardiomyopathy is a dystrophinopathy characterized by severe cardiomyopathy with no skeletal muscle involvement. Several XLCM patients have been described with mutations that abolish dystrophin muscle isoform expression, but with increased expression of brain and cerebellar Purkinje isoforms of the gene exclusively in the skeletal muscle. Bastianutto et al. (2001) determined that 2 XLCM patients bore deletions that removed the muscle promoter and exon 1, but not the brain and cerebellar Purkinje promoters. The brain and cerebellar Purkinje promoters were found to be essentially inac-

tive in muscle cell lines and primary cultures. Since dystrophin muscle enhancer 1 (DME1), a muscle- specific enhancer, is preserved in these patients, the authors tested its ability to upregulate the brain and cerebellar Purkinje promoters in muscle cells. Brain and cerebellar Purkinje promoter activity was significantly increased in the presence of DME1, and activation was observed exclusively in cells presenting a skeletal muscle phenotype versus cardiomyocytes. The authors suggested a role for DME1 in the induction of brain and cerebellar Purkinje isoform expression in the skeletal muscle of XLCM patients defective for muscle isoform expression.

[3198] Animal model experiments lend further support to the function of DMD. Using DNA microarray, Porter et al. (2002) established a molecular signature of dystrophinopathy in the mdx mouse. In leg muscle, 242 differentially expressed genes were identified. Data provided evidence for coordinated activity of numerous components of a chronic inflammatory response, including cytokine and chemokine signaling, leukocyte adhesion and diapedesis, invasive cell type- specific markers, and complement system activation. Upregulation of secreted phosphoprotein 1 (SPP1; 166490) mRNA and protein in

dystrophic muscle identified a novel linkage between inflammatory cells and repair processes. Extracellular matrix genes were upregulated in mdx to levels similar to those in DMD. Since, unlike DMD, mdx exhibits little fibrosis, data suggested that collagen regulation at post-transcriptional stages may mediate extensive fibrosis in DMD.

[3199] It is appreciated that the abovementioned animal model for DMD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3200] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3201] De Angelis, F. [3203] Further studies establishing the function and utilities of DMD are found in John Hopkins OMIM database record ID 300377, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dolichyl-phosphate mannosyltransferase polypeptide 2, regulatory subunit (DPM2, Accession NP_689903.1) is another GAM40 target gene, herein designated TARGET GENE. DPM2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPM2 BINDING SITE, designated SEQ ID:18873, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3204] Another function of GAM40 is therefore inhibition of Dolichyl-phosphate mannosyltransferase polypeptide 2, regulatory subunit (DPM2, Accession NP_689903.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPM2.

[3205] Dolichyl-phosphate mannosyltransferase polypeptide 2, regulatory subunit (DPM2, Accession NP_003854.1) is another GAM40 target gene, herein designated TARGET GENE. DPM2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPM2 BINDING SITE, designated SEQ ID:18873, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3206] Another function of GAM40 is therefore inhibition of Dolichyl-phosphate mannosyltransferase polypeptide 2, regulatory subunit (DPM2, Accession NP_003854.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPM2.

[3207] DT1P1A10 (Accession NP_477511.1) is another GAM40 target gene, herein designated TARGET GENE. DT1P1A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DT1P1A10, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DT1P1A10 BINDING SITE, designated SEQ ID:3408, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3208] Another function of GAM40 is therefore inhibition of DT1P1A10 (Accession NP_477511.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DT1P1A10.

[3209] E74-like factor 5 (ets domain transcription factor) (ELF5, Accession NP_001413.1) is another GAM40 target gene, herein designated TARGET GENE. ELF5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ELF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELF5 BINDING SITE, designated SEQ ID:16375, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3210] Another function of GAM40 is therefore inhibition of E74-like factor 5 (ets domain transcription factor) (ELF5,

Accession NP_001413.1), a gene which may have a role in germline development. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF5.

[3211] The function of ELF5 has been established by previous studies. Members of the ETS family of transcription factors (see OMIM Ref. No. 164720) have been implicated in control of cell proliferation and tumorigenesis. See Sharrocks et al. (1997) for further discussion of the ETS family. Oettgen et al. (1999) isolated a novel epithelium- specific ETS gene, ESE2, by screening a human cDNA database for sequences showing homology to ETS family members. Two isoforms of ESE2 were identified, differing at the amino terminus. ESE2a encodes a predicted protein of 265 amino acids with molecular weight 31.3 kD. ESE2b encodes a protein of 255 amino acids with molecular weight 30.1 kD. ESE2a has a 10- amino acid extension at its amino terminus as compared to ESE2b. ESE2 has several tyrosine kinase, casein kinase II (see OMIM Ref. No. 115440), and protein kinase C (see OMIM Ref. No. 176960) consensus phosphorylation sites. Northern blot analysis of poly(A+) RNA identified an ESE2 transcript between 2.4 and 2.6 kb in length. Expression was highest in

kidney and prostate, both of which have high epithelial cell content. Further analysis by dot blot confirmed expression in epithelial cell- rich tissues, including salivary gland, mammary gland, fetal kidney, and trachea. RT- PCR using isoform- specific PCR primers showed differential expression of ESE2a and 2b. Kidney expressed only ESE2a, while prostate expressed both isoforms, with levels of ESE2b being higher. ESE2 expression was upregulated during keratinocyte differentiation, similar to that of ESE1, but occurred at a later stage. In electrophoretic mobility shift assays, ESE2a did not demonstrate specific binding to a Drosophila E74 ETS binding site. A truncated version of ESE2a lacking the first 42 amino acids did bind this site specifically. The truncated ESE2a also bound to the regulatory regions of several glandular epithelium- specific genes. Zhou et al. (1998) isolated a human ELF5 cDNA from a human lung cDNA library. By PCR using gene- specific primers and the Genebridge 4 radiation hybrid DNA panel, they mapped the ELF5/ESE2 gene to chromosome 11p15- p13, a region of the genome that frequently undergoes loss of heterozygosity in several types of cancer. Upon screening several cancer cell lines for expression, the authors observed ELF5/ESE2 mRNA in a progesterone-

sensitive ductal breast carcinoma cell line only. Southern blot analysis showed evidence of loss of heterozygosity in the lung carcinoma cell lines NCI- H358 and NCI- H441, and rearrangement of the gene in 2 other lung carcinoma cell lines, SK- LU- 1 and NCI- H661.

[3212]

[3213] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3214] Oettgen, P.; Kas, K.; Dube, A.; Gu, X.; Grall, F.; Thamrongsak, U.; Akbarali, Y.; Finger, E.; Boltax, J.; Endress, G.; Munger, K.; Kunsch, C.; Libermann, T. A. : Characterization of ESE- 2, a novel ESE- 1- related ETS transcription factor that is restricted to glandular epithelium and differentiated keratinocytes. J. Biol. Chem. 274: 29439- 29452, 1999. ; and

[3215] Sharrocks, A. D.; Brown, A. L.; Ling, Y.; Yates, P. R. : The ETS- domain transcription factor family. Int. J. Biochem. Cell Biol. 29: 1371- 1387, 1997.

[3216] Further studies establishing the function and utilities of ELF5 are found in John Hopkins OMIM database record ID 605169, and in cited publications listed in Table 5, which are hereby incorporated by reference.Epithelial membrane

protein 1 (EMP1, Accession NP_001414.1) is another GAM40 target gene, herein designated TARGET GENE. EMP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:8730, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3217] Another function of GAM40 is therefore inhibition of Epithelial membrane protein 1 (EMP1, Accession NP_001414.1), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1.

[3218] The function of EMP1 has been established by previous studies. Ben- Porath and Benvenisty (1996) cloned a cDNA encoding epithelial membrane protein- 1 (EMP1), named TMP by them, using RT- PCR on human embryo kidney RNA. Ruegg et al. (1996) independently isolated a cDNA encoding EMP1, termed B4B by them, using differential

display PCR. The predicted 157- amino acid EMP1 protein contains 4 transmembrane domains and 2 potential N-linked glycosylation sites in the first extracellular loop. Chen et al. (1997) found that EMP1, named CL- 20 by them, shares 39% amino acid identity with peripheral myelin protein- 22 (PMP22; 601097); the conserved amino acids are located predominantly within the membrane- spanning domains. Due to the high amino acid sequence homology among PMP22, EMP1, EMP2 (OMIM Ref. No. 602334), and EMP3 (OMIM Ref. No. 602335), Ben- Porath and Benvenisty (1996) proposed that these proteins are members of a novel family. Based on the suggested functions of PMP22, they proposed that EMP1 is involved in cell- cell interactions and the control of cell proliferation. Chen et al. (1997) found that the EMP1 gene contains 5 exons and 4 introns, and they noted that the exon/intron junctions are located at the same positions as those of PMP22, suggesting that EMP1 and PMP22 arose by duplication of a common ancestral gene. Using Northern blot analysis, they detected a 2.8- kb EMP1 transcript in most of the adult tissues examined, but not in brain, liver, pancreas, or peripheral blood leukocytes. Using RT- PCR, Ben- Porath and Benvenisty (1996) detected EMP1 expres-

sion in embryonic kidney, brain, and gut, but not in liver and thymus. Marvin et al. (1995) localized the EMP1 gene to chromosome 12 using a somatic cell hybrid panel. By fluorescence in situ hybridization, Chen et al. (1997) and Ruegg et al. (1996) mapped the EMP1 gene to 12p12 and 20q12- q13.1, respectively. By FISH, somatic cell hybridization, and radiation hybrid analysis, Liehr et al. (1999) confirmed assignment of the EMP1 gene to chromosome 12p12.3. Ben Porath et al. (1998) mapped the homologous gene in the mouse to chromosome 6.

[3219]

[3220] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3221] Ben Porath, I.; Kozak, C. A.; Benvenisty, N. : Chromosomal mapping of Tmp (Emp1), Xmp (Emp2), and Ymp (Emp3), genes encoding membrane proteins related to Pmp22. Genomics 49: 443- 447, 1998. ; and

[3222] Chen, Y.; Medvedev, A.; Ruzanov, P.; Marvin, K. W.; Jetten, A. M. : cDNA cloning, genomic structure, and chromosome mapping of the human epithelial membrane protein CL- 20 gene (EMP1), a.

[3223] Further studies establishing the function and utilities of

EMP1 are found in John Hopkins OMIM database record ID 602333, and in cited publications listed in Table 5, which are hereby incorporated by reference.Erythropoietin (EPO, Accession NP_000790.1) is another GAM40 target gene, herein designated TARGET GENE. EPO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPO BINDING SITE, designated SEQ ID:3988, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3224] Another function of GAM40 is therefore inhibition of Erythropoietin (EPO, Accession NP_000790.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPO.

[3225] FAT3 (Accession XP_061871.5) is another GAM40 target gene, herein designated TARGET GENE. FAT3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FAT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of FAT3 BINDING SITE, designated SEQ ID:4550, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3226] Another function of GAM40 is therefore inhibition of FAT3 (Accession XP_061871.5) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT3.

[3227] F-box and leucine-rich repeat protein 7 (FBXL7, Accession NP_036436.1) is another GAM40 target gene, herein designated TARGET GENE. FBXL7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FBXL7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXL7 BINDING SITE, designated SEQ ID:13859, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3228] Another function of GAM40 is therefore inhibition of F-box and leucine-rich repeat protein 7 (FBXL7, Accession NP_036436.1), a gene which may be involved in in phosphorylation- dependent ubiquitination. Accordingly, utilities of GAM40 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with FBXL7.

[3229] The function of FBXL7 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40- amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F- box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134), F- box proteins), which function in phosphory- lation- dependent ubiquitination. Using a yeast 2- hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F- box proteins, respectively. These contained C termini with leucine- rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Winston et al. (1999) predicted the presence of 12 leucine- rich repeats (LRRs) in FBXL7. RT- PCR analysis detected strong expression in all tissues tested, with highest levels in heart, kidney, liver, and lung.

[3230]

[3231] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[3232] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hirosawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. [3234] Further studies establishing the function and utilities of FBXL7 are found in John Hopkins OMIM database record ID 605656, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ12800 (Accession NP_075054.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ12800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:1742, to the nucleotide sequence of

GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3235] Another function of GAM40 is therefore inhibition of FLJ12800 (Accession NP_075054.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800.

[3236] FLJ12875 (Accession NP_078820.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ12875 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12875, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12875 BINDING SITE, designated SEQ ID:5414, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3237] Another function of GAM40 is therefore inhibition of FLJ12875 (Accession NP_078820.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12875.

[3238] FLJ13154 (Accession NP_078874.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ13154 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ13154, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13154 BINDING SITE, designated SEQ ID:14841, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3239] Another function of GAM40 is therefore inhibition of FLJ13154 (Accession NP_078874.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13154.

[3240] FLJ14082 (Accession NP_079300.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ14082 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14082, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:6617, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3241] Another function of GAM40 is therefore inhibition of FLJ14082 (Accession NP_079300.1) . Accordingly, utilities

of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082.

[3242] FLJ14753 (Accession NP_115947.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ14753 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ14753, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14753 BINDING SITE, designated SEQ ID:17383, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3243] Another function of GAM40 is therefore inhibition of FLJ14753 (Accession NP_115947.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14753.

[3244] FLJ22833 (Accession NP_073748.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ22833 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22833, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ22833 BINDING SITE, designated SEQ ID:18402, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3245] Another function of GAM40 is therefore inhibition of FLJ22833 (Accession NP_073748.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22833.

[3246] FLJ25976 (Accession NP_777603.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ25976 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ25976, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25976 BINDING SITE, designated SEQ ID:11913, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3247] Another function of GAM40 is therefore inhibition of FLJ25976 (Accession NP_777603.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25976.

[3248] FLJ32310 (Accession NP_689549.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ32310

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32310 BINDING SITE, designated SEQ ID:2295, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3249] Another function of GAM40 is therefore inhibition of FLJ32310 (Accession NP_689549.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32310.

[3250] FLJ38771 (Accession NP_775782.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ38771 BINDING SITE1 and FLJ38771 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ38771, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38771 BINDING SITE1 and FLJ38771 BINDING SITE2, designated SEQ ID:10364 and SEQ ID:16753 respectively, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated

SEQ ID:396.

[3251] Another function of GAM40 is therefore inhibition of FLJ38771 (Accession NP_775782.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38771.

[3252] FLJ39249 (Accession NP_775935.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ39249 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39249, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39249 BINDING SITE, designated SEQ ID:17581, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3253] Another function of GAM40 is therefore inhibition of FLJ39249 (Accession NP_775935.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39249.

[3254] FLJ40434 (Accession NP_848596.1) is another GAM40 target gene, herein designated TARGET GENE. FLJ40434 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40434, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40434 BINDING SITE, designated SEQ ID:5127, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3255] Another function of GAM40 is therefore inhibition of FLJ40434 (Accession NP_848596.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40434.

[3256] Interleukin 1 receptor, type i (IL1R1, Accession NP_000868.1) is another GAM40 target gene, herein designated TARGET GENE. IL1R1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1R1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:6956, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3257] Another function of GAM40 is therefore inhibition of Interleukin 1 receptor, type i (IL1R1, Accession NP_000868.1), a gene which is a receptor for interleukin-

1 alpha (il- 1a), beta (il- 1b), and interleukin- 1 receptor antagonist protein (il- 1ra). Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1R1.

[3258] The function of IL1R1 has been established by previous studies. Interleukin- 1, which has a role as a mediator in inflammation, actually consists of 2 separate but related proteins, IL1- alpha (OMIM Ref. No. 147720) and IL1- beta (OMIM Ref. No. 147760). Dower et al. (1986) showed that the cell surface receptors for the 2 forms of interleukin- 1 are identical. Sims et al. (1989) cloned the human IL1R gene and compared it with the mouse gene. Both contain a single membrane- spanning segment, a large cytoplasmic region, and an extracellular, IL1- binding portion composed of 3 immunoglobulin- like domains. The IL1R gene expressed in human dermal fibroblasts was found to be identical to that expressed in T cells. By a combination of somatic cell hybrid analysis and chromosomal in situ hybridization, Copeland et al. (1991) mapped the IL1R gene to human chromosome 2q12. By RFLP analysis in interspecific backcrosses, Copeland et al. (1991) mapped the corresponding mouse gene at the centromeric end of chromosome 1, a region homologous

to a portion of human chromosome 2

[3259]

[3260] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3261] Dower, S. K.; Kronheim, S. R.; Hopp, T. P.; Cantrell, M.; Deeley, M.; Gillis, S.; Henney, C. S.; Urdal, D. L. : The cell surface receptors for interleukin- 1(alpha) and inter- leukin- 1(beta) are identical. Nature 324: 266- 268, 1986. ; and

[3262] Sims, J. E.; Acres, R. B.; Grubin, C. E.; McMahan, C. J.; Wig- nall, J. M.; March, C. J.; Dower, S. K. : Cloning the inter- leukin 1 receptor from human T cells. Proc. Nat. Acad. Sci. 86: 89.

[3263] Further studies establishing the function and utilities of IL1R1 are found in John Hopkins OMIM database record ID 147810, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interferon regulatory factor 4 (IRF4, Accession NP_002451.1) is another GAM40 target gene, herein designated TARGET GENE. IRF4 BIND- ING SITE is a target binding site found in the 3` untrans- lated region of mRNA encoded by IRF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRF4 BINDING SITE, designated SEQ ID:18288, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3264] Another function of GAM40 is therefore inhibition of Interferon regulatory factor 4 (IRF4, Accession NP_002451.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF4.

[3265] Insulin receptor substrate 3-like (IRS3L, Accession XP_295210.1) is another GAM40 target gene, herein designated TARGET GENE. IRS3L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IRS3L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRS3L BINDING SITE, designated SEQ ID:11000, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3266] Another function of GAM40 is therefore inhibition of Insulin receptor substrate 3-like (IRS3L, Accession XP_295210.1) . Accordingly, utilities of GAM40 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with IRS3L.

[3267] Integrin, alpha 10 (ITGA10, Accession NP_003628.1) is another GAM40 target gene, herein designated TARGET GENE. ITGA10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITGA10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGA10 BINDING SITE, designated SEQ ID:19590, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3268] Another function of GAM40 is therefore inhibition of Integrin, alpha 10 (ITGA10, Accession NP_003628.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA10.

[3269] Kallmann syndrome 1 sequence (KAL1, Accession NP_000207.1) is another GAM40 target gene, herein designated TARGET GENE. KAL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KAL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KAL1 BINDING SITE, designated SEQ ID:4267, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3270] Another function of GAM40 is therefore inhibition of Kallmann syndrome 1 sequence (KAL1, Accession NP_000207.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAL1.

[3271] Potassium voltage-gated channel, shaker-related subfamily, beta member 2 (KCNAB2, Accession NP_742128.1) is another GAM40 target gene, herein designated TARGET GENE. KCNAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNAB2 BINDING SITE, designated SEQ ID:13392, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3272] Another function of GAM40 is therefore inhibition of Potassium voltage-gated channel, shaker-related subfam-

ily, beta member 2 (KCNAB2, Accession NP_742128.1), a gene which is the beta subunit of shaker voltage- gated potassium channels. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB2.

[3273] The function of KCNAB2 has been established by previous studies. 'Shaker' and other voltage- dependent potassium channel proteins help to determine the electrical properties of excitable cells and play additional physiologic roles in nonexcitable cell types. See KCNA1 (OMIM Ref. No. 176260). Mammalian Shaker potassium channel alpha subunits associate with cytoplasmic beta subunits that modulate the inactivation of the channel. The beta subunits belong to a superfamily of NAD(P)H- dependent enzymes, suggesting that they may be involved in additional physiologic processes. Shaker potassium channel complexes are thought to be composed of 4 alpha and 4 beta subunits. By PCR of a human hippocampal library with degenerate primers based on conserved regions of rat beta-1 (KCNA1B; 601141) and beta- 2 subunits, McCormack et al. (1995) isolated cDNAs encoding human beta- 1 and beta- 2. The predicted 367- amino acid human, bovine, and rat beta- 2 subunits are 99% identical. Unlike beta- 1,

the beta- 2 subunit does not contain an N- terminal inactivation 'ball' domain. Instead, functional studies of beta-2 expressed in Xenopus oocytes indicated that it increased the rate of the endogenous Kv1.4 alpha subunit (OMIM Ref. No. 176266) inactivation process. Leicher et al. (1998) reported that the KCNA2B gene contains 15 exons and spans approximately 70 kb. The exon/intron structure of KCNA2B is comparable to that of KCNA1B and KCNA3B (OMIM Ref. No. 604111), although the size of the introns varies significantly among the genes. By analysis of somatic cell hybrids and by FISH, Schultz et al. (1996) mapped the KCNA2B gene to 1p36.3. The results of Gong et al. (1999) suggested that ZIP, the rat homolog of p62 (OMIM Ref. No. 601530), acts as a link that targets the activity of Kv- beta- 2 and PKC- zeta

[3274]

[3275] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3276] Gong, J.; Xu, J.; Bezanilla, M.; van Huizen, R.; Derin, R.; Li, M. : Differential stimulation of PKC phosphorylation of potassium channels by ZIP1 and ZIP2. Science 285: 1565-1569, 1999. ; and

[3277] Leicher, T.; Bahring, R.; Isbrandt, D.; Pongs, O. : Coexpression of the KCNA3B gene product with Kv1.5 leads to a novel A- type potassium channel. J. Biol. Chem. 273: 35095- 35101, 1998.

[3278] Further studies establishing the function and utilities of KCNAB2 are found in John Hopkins OMIM database record ID 601142, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium voltage-gated channel, shaker-related subfamily, beta member 2 (KCNAB2, Accession NP_003627.1) is another GAM40 target gene, herein designated TARGET GENE. KCNAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNAB2 BINDING SITE, designated SEQ ID:13392, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3279] Another function of GAM40 is therefore inhibition of Potassium voltage-gated channel, shaker-related subfamily, beta member 2 (KCNAB2, Accession NP_003627.1), a

gene which is the beta subunit of shaker voltage- gated potassium channels. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB2.

[3280] The function of KCNAB2 has been established by previous studies. 'Shaker' and other voltage- dependent potassium channel proteins help to determine the electrical properties of excitable cells and play additional physiologic roles in nonexcitable cell types. See KCNA1 (OMIM Ref. No. 176260). Mammalian Shaker potassium channel alpha subunits associate with cytoplasmic beta subunits that modulate the inactivation of the channel. The beta subunits belong to a superfamily of NAD(P)H- dependent enzymes, suggesting that they may be involved in additional physiologic processes. Shaker potassium channel complexes are thought to be composed of 4 alpha and 4 beta subunits. By PCR of a human hippocampal library with degenerate primers based on conserved regions of rat beta-1 (KCNA1B; 601141) and beta- 2 subunits, McCormack et al. (1995) isolated cDNAs encoding human beta- 1 and beta- 2. The predicted 367- amino acid human, bovine, and rat beta- 2 subunits are 99% identical. Unlike beta- 1, the beta- 2 subunit does not contain an N- terminal inac-

tivation 'ball' domain. Instead, functional studies of beta-2 expressed in Xenopus oocytes indicated that it increased the rate of the endogenous Kv1.4 alpha subunit (OMIM Ref. No. 176266) inactivation process. Leicher et al. (1998) reported that the KCNA2B gene contains 15 exons and spans approximately 70 kb. The exon/intron structure of KCNA2B is comparable to that of KCNA1B and KCNA3B (OMIM Ref. No. 604111), although the size of the introns varies significantly among the genes. [3283] Gong, J.; Xu, J.; Bezanilla, M.; van Huizen, R.; Derin, R.; Li, M. : Differential stimulation of PKC phosphorylation of potassium channels by ZIP1 and ZIP2. Science 285: 1565-1569, 1999. ; and

[3284] Leicher, T.; Bahring, R.; Isbrandt, D.; Pongs, O. : Coex-

pression of the KCNA3B gene product with Kv1.5 leads to a novel A- type potassium channel. J. Biol. Chem. 273: 35095- 35101, 1998.

[3285] Further studies establishing the function and utilities of KCNAB2 are found in John Hopkins OMIM database record ID 601142, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0215 (Accession NP_055550.1) is another GAM40 target gene, herein designated TARGET GENE. KIAA0215 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0215, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0215 BINDING SITE, designated SEQ ID:13419, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3286] Another function of GAM40 is therefore inhibition of KIAA0215 (Accession NP_055550.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0215.

[3287] KIAA0239 (Accession NP_056103.2) is another GAM40

target gene, herein designated TARGET GENE. KIAA0239 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0239, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0239 BINDING SITE, designated SEQ ID:7703, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3288] Another function of GAM40 is therefore inhibition of KIAA0239 (Accession NP_056103.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0239.

[3289] KIAA0326 (Accession XP_034819.1) is another GAM40 target gene, herein designated TARGET GENE. KIAA0326 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0326, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0326 BINDING SITE, designated SEQ ID:1236, to the nucleotide sequence of GAM40 RNA, herein designated

GAM RNA, also designated SEQ ID:396.

[3290] Another function of GAM40 is therefore inhibition of KIAA0326 (Accession XP_034819.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0326.

[3291] KIAA0534 (Accession XP_049349.8) is another GAM40 target gene, herein designated TARGET GENE. KIAA0534 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0534, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:6434, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3292] Another function of GAM40 is therefore inhibition of KIAA0534 (Accession XP_049349.8) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534.

[3293] KIAA0794 (Accession XP_087353.4) is another GAM40 target gene, herein designated TARGET GENE. KIAA0794

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0794, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:1060, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3294] Another function of GAM40 is therefore inhibition of KIAA0794 (Accession XP_087353.4) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794.

[3295] KIAA1157 (Accession XP_051093.2) is another GAM40 target gene, herein designated TARGET GENE. KIAA1157 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1157, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:14430, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3296] Another function of GAM40 is therefore inhibition of KIAA1157 (Accession XP_051093.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157.

[3297] KIAA1463 (Accession XP_051160.2) is another GAM40 target gene, herein designated TARGET GENE. KIAA1463 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1463, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:4325, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3298] Another function of GAM40 is therefore inhibition of KIAA1463 (Accession XP_051160.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463.

[3299] KIAA1729 (Accession XP_114418.2) is another GAM40 target gene, herein designated TARGET GENE. KIAA1729 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1729, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:4832, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3300] Another function of GAM40 is therefore inhibition of KIAA1729 (Accession XP_114418.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729.

[3301] KIAA1935 (Accession XP_087672.1) is another GAM40 target gene, herein designated TARGET GENE. KIAA1935 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1935, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1935 BINDING SITE, designated SEQ ID:19854, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3302] Another function of GAM40 is therefore inhibition of

KIAA1935 (Accession XP_087672.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1935.

[3303] KIAA2001 (Accession XP_291322.1) is another GAM40 target gene, herein designated TARGET GENE. KIAA2001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA2001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2001 BINDING SITE, designated SEQ ID:9738, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3304] Another function of GAM40 is therefore inhibition of KIAA2001 (Accession XP_291322.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2001.

[3305] Kruppel-like factor 12 (KLF12, Accession NP_057369.1) is another GAM40 target gene, herein designated TARGET GENE. KLF12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by KLF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLF12 BINDING SITE, designated SEQ ID:8149, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3306] Another function of GAM40 is therefore inhibition of Kruppel-like factor 12 (KLF12, Accession NP_057369.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF12.

[3307] Kelch-like 3 (drosophila) (KLHL3, Accession NP_059111.1) is another GAM40 target gene, herein designated TARGET GENE. KLHL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KLHL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:3437, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3308] Another function of GAM40 is therefore inhibition of

Kelch-like 3 (drosophila) (KLHL3, Accession NP_059111.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3.

[3309] Kelch-like 6 (drosophila) (KLHL6, Accession NP_569713.1) is another GAM40 target gene, herein designated TARGET GENE. KLHL6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KLHL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:5266, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3310] Another function of GAM40 is therefore inhibition of Kelch-like 6 (drosophila) (KLHL6, Accession NP_569713.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6.

[3311] Lim domain binding 3 (LDB3, Accession XP_084376.6) is another GAM40 target gene, herein designated TARGET GENE. LDB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LDB3,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LDB3 BINDING SITE, designated SEQ ID:3058, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3312] Another function of GAM40 is therefore inhibition of Lim domain binding 3 (LDB3, Accession XP_084376.6), a gene which could play a role during mating. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDB3.

[3313] The function of LDB3 has been established by previous studies. PDZ domain- containing proteins interact with each other in cytoskeletal assembly or with other proteins involved in targeting and clustering of membrane proteins By screening a muscle cDNA library using a muscle EST sequence as the probe, Faulkner et al. (1999) obtained cDNAs encoding mouse and human ZASP. The deduced 283- amino acid human ZASP protein has an 85- residue N- terminal PDZ domain and shares significant similarity with the 734- amino acid protein encoded by the KIAA0613 cDNA isolated by Ishikawa et al. (1998).

Database, PCR, and genomic DNA analyses indicated the presence of alternatively spliced isoforms of ZASP that encode proteins of 470, 617, and 727 (KIAA0613) amino acids. Northern blot analysis detected a major 1.9- kb ZASP transcript that was most abundant in skeletal muscle and heart but absent in other tissues tested. Additional transcripts of 4.0 and 5.4 kb were detected when using a 5- prime rather than a 3- prime probe. RT- PCR analysis detected wide expression of KIAA0613, with weak or undetectable expression in liver, pancreas, and spleen (Ishikawa et al., 1998). Western blot analysis showed expression of 32- and 78- kD proteins in heart and muscle. Immunofluorescence microscopy demonstrated that ZASP is expressed in pseudopodia and in the cytoplasm around the nucleus, and that it colocalizes with actin in the I- band. Immunoelectron microscopy localized ZASP within the Z- band. Yeast 2- hybrid analysis determined that the PDZ domain of ZASP interacts with the C terminus of alpha- actinin- 2 (ACTN2; 102573

[3314]

[3315] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3316] Faulkner, G.; Pallavicini, A.; Formentin, E.; Comelli, A.; Ievolella, C.; Trevisan, S.; Bortoletto, G.; Scannapieco, P.; Salamon, M.; Mouly, V.; Valle, G.; Lanfranchi, G. : ZASP: a new Z- band alternatively spliced PDZ- motif protein. J. Cell Biol. 146: 465- 475, 1999. ; and

[3317] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete sequence.

[3318] Further studies establishing the function and utilities of LDB3 are found in John Hopkins OMIM database record ID 605906, and in cited publications listed in Table 5, which are hereby incorporated by reference.Link-GEFII (Accession NP_057423.1) is another GAM40 target gene, herein designated TARGET GENE. Link-GEFII BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Link-GEFII, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Link-GEFII BINDING SITE, designated SEQ ID:576, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3319] Another function of GAM40 is therefore inhibition of Link-GEFII (Accession NP_057423.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Link-GEFII.

[3320] LOC116064 (Accession XP_057296.1) is another GAM40 target gene, herein designated TARGET GENE. LOC116064 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC116064, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116064 BINDING SITE, designated SEQ ID:16127, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3321] Another function of GAM40 is therefore inhibition of LOC116064 (Accession XP_057296.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116064.

[3322] LOC130612 (Accession XP_059461.1) is another GAM40 target gene, herein designated TARGET GENE. LOC130612 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC130612, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130612 BINDING SITE, designated SEQ ID:14210, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3323] Another function of GAM40 is therefore inhibition of LOC130612 (Accession XP_059461.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130612.

[3324] LOC133926 (Accession XP_059674.1) is another GAM40 target gene, herein designated TARGET GENE. LOC133926 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC133926, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133926 BINDING SITE, designated SEQ ID:2660, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3325] Another function of GAM40 is therefore inhibition of

LOC133926 (Accession XP_059674.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133926.

[3326] LOC146333 (Accession XP_091306.2) is another GAM40 target gene, herein designated TARGET GENE. LOC146333 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146333, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146333 BINDING SITE, designated SEQ ID:2307, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3327] Another function of GAM40 is therefore inhibition of LOC146333 (Accession XP_091306.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146333.

[3328] LOC147123 (Accession XP_085714.2) is another GAM40 target gene, herein designated TARGET GENE. LOC147123 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147123, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147123 BINDING SITE, designated SEQ ID:9200, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3329] Another function of GAM40 is therefore inhibition of LOC147123 (Accession XP_085714.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147123.

[3330] LOC149271 (Accession XP_086475.1) is another GAM40 target gene, herein designated TARGET GENE. LOC149271 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149271, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:3643, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3331] Another function of GAM40 is therefore inhibition of LOC149271 (Accession XP_086475.1) . Accordingly, utili-

ties of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271.

[3332] LOC157623 (Accession XP_088346.6) is another GAM40 target gene, herein designated TARGET GENE. LOC157623 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157623, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157623 BINDING SITE, designated SEQ ID:16783, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3333] Another function of GAM40 is therefore inhibition of LOC157623 (Accession XP_088346.6) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157623.

[3334] LOC157693 (Accession XP_088366.2) is another GAM40 target gene, herein designated TARGET GENE. LOC157693 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157693, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157693 BINDING SITE, designated SEQ ID:545, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3335] Another function of GAM40 is therefore inhibition of LOC157693 (Accession XP_088366.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157693.

[3336] LOC158969 (Accession XP_088728.1) is another GAM40 target gene, herein designated TARGET GENE. LOC158969 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158969, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158969 BINDING SITE, designated SEQ ID:14337, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3337] Another function of GAM40 is therefore inhibition of LOC158969 (Accession XP_088728.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158969.

[3338] LOC162083 (Accession XP_091339.2) is another GAM40 target gene, herein designated TARGET GENE. LOC162083 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC162083, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162083 BINDING SITE, designated SEQ ID:8480, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3339] Another function of GAM40 is therefore inhibition of LOC162083 (Accession XP_091339.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162083.

[3340] LOC163742 (Accession XP_089112.3) is another GAM40 target gene, herein designated TARGET GENE. LOC163742 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC163742, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC163742 BINDING SITE, designated SEQ ID:5127, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3341] Another function of GAM40 is therefore inhibition of LOC163742 (Accession XP_089112.3) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163742.

[3342] LOC197342 (Accession XP_113869.1) is another GAM40 target gene, herein designated TARGET GENE. LOC197342 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197342, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:8342, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3343] Another function of GAM40 is therefore inhibition of LOC197342 (Accession XP_113869.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC197342.

[3344] LOC197358 (Accession XP_113872.2) is another GAM40 target gene, herein designated TARGET GENE. LOC197358 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197358, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:9461, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3345] Another function of GAM40 is therefore inhibition of LOC197358 (Accession XP_113872.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358.

[3346] LOC201617 (Accession XP_117315.1) is another GAM40 target gene, herein designated TARGET GENE. LOC201617 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201617, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC201617 BINDING SITE, designated SEQ ID:15732, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3347] Another function of GAM40 is therefore inhibition of LOC201617 (Accession XP_117315.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201617.

[3348] LOC253228 (Accession XP_171113.3) is another GAM40 target gene, herein designated TARGET GENE. LOC253228 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC253228, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253228 BINDING SITE, designated SEQ ID:12568, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3349] Another function of GAM40 is therefore inhibition of LOC253228 (Accession XP_171113.3) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253228.

[3350] LOC253559 (Accession NP_694854.1) is another GAM40 target gene, herein designated TARGET GENE. LOC253559 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC253559, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253559 BINDING SITE, designated SEQ ID:17582, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3351] Another function of GAM40 is therefore inhibition of LOC253559 (Accession NP_694854.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253559.

[3352] LOC256372 (Accession XP_170878.1) is another GAM40 target gene, herein designated TARGET GENE. LOC256372 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256372, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256372 BINDING SITE, designated SEQ ID:7091, to

the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3353] Another function of GAM40 is therefore inhibition of LOC256372 (Accession XP_170878.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256372.

[3354] LOC283877 (Accession XP_211240.1) is another GAM40 target gene, herein designated TARGET GENE. LOC283877 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283877, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283877 BINDING SITE, designated SEQ ID:13171, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3355] Another function of GAM40 is therefore inhibition of LOC283877 (Accession XP_211240.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283877.

[3356] LOC283894 (Accession XP_211250.1) is another GAM40

target gene, herein designated TARGET GENE. LOC283894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283894 BINDING SITE, designated SEQ ID:16848, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3357] Another function of GAM40 is therefore inhibition of LOC283894 (Accession XP_211250.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283894.

[3358] LOC283909 (Accession XP_211256.1) is another GAM40 target gene, herein designated TARGET GENE. LOC283909 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283909 BINDING SITE, designated SEQ ID:16848, to the nucleotide sequence of GAM40 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:396.

[3359] Another function of GAM40 is therefore inhibition of LOC283909 (Accession XP_211256.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283909.

[3360] LOC284173 (Accession XP_211362.1) is another GAM40 target gene, herein designated TARGET GENE. LOC284173 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284173, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284173 BINDING SITE, designated SEQ ID:9638, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3361] Another function of GAM40 is therefore inhibition of LOC284173 (Accession XP_211362.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284173.

[3362] LOC284573 (Accession XP_209272.1) is another GAM40 target gene, herein designated TARGET GENE. LOC284573

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284573, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284573 BINDING SITE, designated SEQ ID:17120, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3363] Another function of GAM40 is therefore inhibition of LOC284573 (Accession XP_209272.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284573.

[3364] LOC284857 (Accession XP_211671.1) is another GAM40 target gene, herein designated TARGET GENE. LOC284857 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284857, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284857 BINDING SITE, designated SEQ ID:1215, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3365] Another function of GAM40 is therefore inhibition of LOC284857 (Accession XP_211671.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284857.

[3366] LOC285122 (Accession XP_211770.1) is another GAM40 target gene, herein designated TARGET GENE. LOC285122 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285122 BINDING SITE, designated SEQ ID:16376, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3367] Another function of GAM40 is therefore inhibition of LOC285122 (Accession XP_211770.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285122.

[3368] LOC285397 (Accession XP_211876.1) is another GAM40 target gene, herein designated TARGET GENE. LOC285397 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC285397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285397 BINDING SITE, designated SEQ ID:10325, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3369] Another function of GAM40 is therefore inhibition of LOC285397 (Accession XP_211876.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285397.

[3370] LOC285582 (Accession XP_211943.1) is another GAM40 target gene, herein designated TARGET GENE. LOC285582 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285582, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285582 BINDING SITE, designated SEQ ID:2315, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3371] Another function of GAM40 is therefore inhibition of

LOC285582 (Accession XP_211943.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285582.

[3372] LOC285733 (Accession XP_212006.1) is another GAM40 target gene, herein designated TARGET GENE. LOC285733 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285733, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285733 BINDING SITE, designated SEQ ID:6307, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3373] Another function of GAM40 is therefore inhibition of LOC285733 (Accession XP_212006.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285733.

[3374] LOC317671 (Accession NP_775498.1) is another GAM40 target gene, herein designated TARGET GENE. LOC317671 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC317671, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC317671 BINDING SITE, designated SEQ ID:13035, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3375] Another function of GAM40 is therefore inhibition of LOC317671 (Accession NP_775498.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC317671.

[3376] LOC338909 (Accession XP_294744.1) is another GAM40 target gene, herein designated TARGET GENE. LOC338909 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338909 BINDING SITE, designated SEQ ID:9478, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3377] Another function of GAM40 is therefore inhibition of LOC338909 (Accession XP_294744.1) . Accordingly, utili-

ties of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338909.

[3378] LOC339604 (Accession XP_293152.2) is another GAM40 target gene, herein designated TARGET GENE. LOC339604 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339604, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339604 BINDING SITE, designated SEQ ID:5510, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3379] Another function of GAM40 is therefore inhibition of LOC339604 (Accession XP_293152.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339604.

[3380] LOC339694 (Accession XP_295035.1) is another GAM40 target gene, herein designated TARGET GENE. LOC339694 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339694, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339694 BINDING SITE, designated SEQ ID:4299, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3381] Another function of GAM40 is therefore inhibition of LOC339694 (Accession XP_295035.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339694.

[3382] LOC344543 (Accession XP_297702.2) is another GAM40 target gene, herein designated TARGET GENE. LOC344543 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC344543, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC344543 BINDING SITE, designated SEQ ID:18874, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3383] Another function of GAM40 is therefore inhibition of LOC344543 (Accession XP_297702.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC344543.

[3384] LOC345422 (Accession XP_298768.2) is another GAM40 target gene, herein designated TARGET GENE. LOC345422 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC345422, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC345422 BINDING SITE, designated SEQ ID:14296, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3385] Another function of GAM40 is therefore inhibition of LOC345422 (Accession XP_298768.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC345422.

[3386] LOC351887 (Accession XP_305245.1) is another GAM40 target gene, herein designated TARGET GENE. LOC351887 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351887, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC351887 BINDING SITE, designated SEQ ID:19662, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3387] Another function of GAM40 is therefore inhibition of LOC351887 (Accession XP_305245.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC351887.

[3388] LOC91464 (Accession XP_038589.1) is another GAM40 target gene, herein designated TARGET GENE. LOC91464 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91464, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91464 BINDING SITE, designated SEQ ID:3304, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3389] Another function of GAM40 is therefore inhibition of LOC91464 (Accession XP_038589.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91464.

[3390] LOC92597 (Accession NP_775739.1) is another GAM40 target gene, herein designated TARGET GENE. LOC92597 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92597, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92597 BINDING SITE, designated SEQ ID:5178, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3391] Another function of GAM40 is therefore inhibition of LOC92597 (Accession NP_775739.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92597.

[3392] Mannan-binding lectin serine protease 1 (c4/c2 activating component of ra-reactive factor) (MASP1, Accession NP_001870.3) is another GAM40 target gene, herein designated TARGET GENE. MASP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MASP1, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:18072, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3393] Another function of GAM40 is therefore inhibition of Mannan-binding lectin serine protease 1 (c4/c2 activating component of ra-reactive factor) (MASP1, Accession NP_001870.3), a gene which a complement- dependent bactericidal factor . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1.

[3394] The function of MASP1 has been established by previous studies. The Ra- reactive factor (RARF) is a complement-dependent bactericidal factor that binds to the Ra and R2 polysaccharides expressed by certain enterobacteria. RARF activity is found in the sera of a diverse group of vertebrates, suggesting that it is an evolutionarily conserved mechanism to resist infection by these bacterial strains. RARF includes a 100- kD component, CRARF, also called MASP1 or p100, that was thought to activate the complement components C4 (C4F, 120820; C4S, 120810), C2 (OMIM Ref. No. 217000), and C3 (OMIM Ref. No.

120700). Subsequent work, however, separated MASP1 from MASP2 (OMIM Ref. No. 605102) and showed that MASP1 activates C3 and C2, whereas MASP2 activates C4 and C2. The other component of RARF is mannan- binding lectin (OMIM Ref. No. 154545), a plasma protein member of the complement system that binds to microbial carbohydrates and activates the MASPs. The MASPs then recruit C4 and C2 to generate the C3 convertase or directly activate C3. Takada et al. (1993) cloned a partial human CRARF cDNA from a liver library. The human CRARF amino acid sequence is similar to the human complement subcomponents C1R (OMIM Ref. No. 216950) and C1S (OMIM Ref. No. 120580). Takada et al. (1995) obtained a corresponding mouse cDNA. By RT- PCR with primers based on N- terminal peptide sequence analysis and the consensus sequence of serine proteases, followed by screening a fetal liver cDNA library, Sato et al. (1994) isolated a cDNA encoding MASP. Sequence analysis predicted that the 699- amino acid protein contains a leader peptide; 2 structural domains similar to those of C1R and C1S; an EGF- like domain thought to be related to calcium- binding activity; 2 short consensus repeat domains; and a serine protease domain. Northern blot analysis re-

vealed expression of 4.8- and 3.4- kb MASP transcripts in fetal liver; no expression was detected in adult tissues or in fetal heart, brain, lung, or kidney. Sato et al. (1994) proposed that the MBL- MASP complex is a novel activator of complement in what they designated the lectin pathway. By biochemical purification of plasma proteins and immunoblot analysis, Dahl et al. (2001) detected a 42- kD serine protease associated with MBL. They identified a cDNA encoding this protein, MASP3, which is generated by alternative splicing of MASP1. The MASP3 transcription product is composed of an A chain, which is common to both MASP1 and MASP3, and a B chain, which is unique to MASP3. The deduced 728- amino acid MASP3 protein has a signal peptide, 3 N- glycosylation sites on the B chain and 4 on the A chain. Sato et al. (1994) mapped the MASP1 gene to 3q27- q28 by FISH. Using FISH, Takada et al. (1995) mapped the human CRARF gene to 3q27- q28 and the mouse gene to 16B2- B3, regions thought to share homology of synteny.

[3395]

[3396] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3397] Dahl, M. R.; Thiel, S.; Matsushita, M.; Fujita, T.; Willis, A. C.; Christensen, T.; Vorup- Jensen, T.; Jensenius, J. C. : MASP- 3 and its association with distinct complexes of the mannan- binding lectin complement activation pathway. Immunity 15: 127- 135, 2001. ; and

[3398] Takada, F.; Seki, N.; Matsuda, Y.; Takayama, Y.; Kawakami, M. : Localization of the genes for the 100- kDa complement- activating components of Ra- reactive factor (CRARF and Crarf) to hum.

[3399] Further studies establishing the function and utilities of MASP1 are found in John Hopkins OMIM database record ID 600521, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC20481 (Accession NP_443081.1) is another GAM40 target gene, herein designated TARGET GENE. MGC20481 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC20481, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC20481 BINDING SITE, designated SEQ ID:5846, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3400] Another function of GAM40 is therefore inhibition of MGC20481 (Accession NP_443081.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20481.

[3401] MGC21874 (Accession XP_291105.1) is another GAM40 target gene, herein designated TARGET GENE. MGC21874 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC21874, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC21874 BINDING SITE, designated SEQ ID:11186, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3402] Another function of GAM40 is therefore inhibition of MGC21874 (Accession XP_291105.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21874.

[3403] MGC26778 (Accession NP_659447.1) is another GAM40 target gene, herein designated TARGET GENE. MGC26778 BINDING SITE1 and MGC26778 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by MGC26778, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC26778 BINDING SITE1 and MGC26778 BINDING SITE2, designated SEQ ID:19180 and SEQ ID:2280 respectively, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3404] Another function of GAM40 is therefore inhibition of MGC26778 (Accession NP_659447.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26778.

[3405] MGC3101 (Accession NP_076948.1) is another GAM40 target gene, herein designated TARGET GENE. MGC3101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:756, to the nucleotide sequence of GAM40 RNA, herein designated

GAM RNA, also designated SEQ ID:396.

[3406] Another function of GAM40 is therefore inhibition of MGC3101 (Accession NP_076948.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101.

[3407] MGC39325 (Accession NP_671722.1) is another GAM40 target gene, herein designated TARGET GENE. MGC39325 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC39325, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39325 BINDING SITE, designated SEQ ID:3154, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3408] Another function of GAM40 is therefore inhibition of MGC39325 (Accession NP_671722.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39325.

[3409] Nerve growth factor, beta polypeptide (NGFB, Accession NP_002497.1) is another GAM40 target gene, herein designated TARGET GENE. NGFB BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by NGFB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NGFB BINDING SITE, designated SEQ ID:19589, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3410] Another function of GAM40 is therefore inhibition of Nerve growth factor, beta polypeptide (NGFB, Accession NP_002497.1), a gene which is important for the development and maintenance of the sympathetic and sensory nervous systems. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFB.

[3411] The function of NGFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM34.1.NLI-IF (Accession NP_067021.1) is another GAM40 target gene, herein designated TARGET GENE. NLI-IF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NLI-IF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of NLI-IF BINDING SITE, designated SEQ ID:12146, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3412] Another function of GAM40 is therefore inhibition of NLI-IF (Accession NP_067021.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLI-IF.

[3413] Nephronophthisis 4 (NPHP4, Accession NP_055917.1) is another GAM40 target gene, herein designated TARGET GENE. NPHP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPHP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPHP4 BINDING SITE, designated SEQ ID:19408, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3414] Another function of GAM40 is therefore inhibition of Nephronophthisis 4 (NPHP4, Accession NP_055917.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPHP4.

[3415] Nuclear receptor subfamily 0, group b, member 2 (NR0B2, Accession NP_068804.1) is another GAM40 target gene, herein designated TARGET GENE. NR0B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NR0B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR0B2 BINDING SITE, designated SEQ ID:17061, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3416] Another function of GAM40 is therefore inhibition of Nuclear receptor subfamily 0, group b, member 2 (NR0B2, Accession NP_068804.1), a gene which may be a negative regulator of receptor- dependent signaling pathways. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR0B2.

[3417] The function of NR0B2 has been established by previous studies. Using a yeast 2- hybrid system with a mouse relative of human MB67 (NR1I3; 603881) as the bait, Seol et al. (1996) cloned mouse liver cDNAs encoding Nr0b2, which they named Shp for 'small heterodimer partner.' By

screening a human liver cDNA library with a mouse Nr0b2 cDNA, they isolated a human NR0B2 cDNA. Northern blot analysis of human tissues detected an approximately 1.3-kb NR0B2 transcript in liver; lower levels of expression were detected in heart and pancreas. The predicted 257-amino acid NR0B2 protein contains the ligand- binding and dimerization domains found in other nuclear hormone receptor superfamily members but lacks the conserved DNA- binding domain. The closest relative of Nr0b2 among known family members is Dax1 (NR0B1; 300200). Both in vitro and in the yeast 2- hybrid system, Nr0b2 interacted with several conventional and orphan members of the receptor superfamily, including retinoid receptors RAR (see OMIM Ref. No. 180240) and RXR (see OMIM Ref. No. 180245), thyroid hormone receptor (see OMIM Ref. No. 190160), and the orphan receptor MB67. In mammalian cells, Nr0b2 specifically inhibited transactivation by the superfamily members with which it interacted. Seol et al. (1996) suggested that NR0B2 functions as a negative regulator of receptor- dependent signaling pathways. Goodwin et al. (2000) used a potent, nonsteroidal FXR ligand to show that FXR induces expression of SHP1, an atypical member of the nuclear receptor family that

lacks a DNA- binding domain. SHP1 represses expression of CYP7A1 by inhibiting the activity of LRH1, an orphan nuclear receptor that regulates CYP7A1 expression positively. This bile acid- activated regulatory cascade provides a molecular basis for the coordinate suppression of CYP7A1 and other genes involved in bile acid biosynthesis.

[3418]

[3419] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3420] Goodwin, B.; Jones, S. A.; Price, R. R.; Watson, M. A.; McKee, D. D.; Moore, L. B.; Galardi, C.; Wilson, J. G.; Lewis, M. C.; Roth, M. E.; Maloney, P. R.; Willson, T. M.; Kliewer, S. A. : A regulatory cascade of the nuclear receptors FXR, SHP-1, and LRH- 1 represses bile acid biosynthesis. Molec. Cell 6: 517- 526, 2000. ; and

[3421] Seol, W.; Choi, H.- S.; Moore, D. D. : An orphan nuclear hormone receptor that lacks a DNA binding domain and heterodimerizes with other receptors. Science 272: 1336-1339, 1996.

[3422] Further studies establishing the function and utilities of NR0B2 are found in John Hopkins OMIM database record

ID 604630, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear receptor subfamily 3, group c, member 2 (NR3C2, Accession NP_000892.1) is another GAM40 target gene, herein designated TARGET GENE. NR3C2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NR3C2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR3C2 BINDING SITE, designated SEQ ID:13835, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3423] Another function of GAM40 is therefore inhibition of Nuclear receptor subfamily 3, group c, member 2 (NR3C2, Accession NP_000892.1), a gene which is to increase ion and water transport and thus raise extracellular fluid volume and blood pressure and lower potassium levels. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C2.

[3424] The function of NR3C2 has been established by previous studies. Arriza et al. (1987) used low- stringency hybridization with human glucocorticoid receptor cDNA to

isolate a new gene encoding a predicted 107- kD polypeptide. Expression studies demonstrated its ability to bind aldosterone with high affinity and to activate gene transcription in response to aldosterone, thus establishing its identity as the human mineralocorticoid receptor. This molecule also showed high affinity for glucocorticoids. They speculated that, since the circulating level of glucocorticoids is several times higher than those of aldosterone, the primary mineralocorticoid, glucocorticoid activation of the mineralocorticoid receptor may be functionally significant. The gene for the estrogen receptor (OMIM Ref. No. 133430) and that for the progesterone receptor (OMIM Ref. No. 607311) have also been cloned.

[3425] Animal model experiments lend further support to the function of NR3C2. Berger et al. (1998) generated MLR-deficient mice by gene targeting. These mice had a normal prenatal development. During the first week of life, the MLR- deficient mice developed symptoms of pseudohypoaldosteronism. They lost weight and eventually died at approximately 10 days after birth from dehydration by renal sodium and water loss. At day 8, MLR - /- mice showed hyperkalemia, hyponatremia, and a strong increase in renin, angiotensin II, and aldosterone plasma

concentrations. The fractional renal Na+ excretion was elevated more than 8- fold. The glomerular filtration rate in MLR - /- mice was not different from that in controls. The effect of amiloride on renal Na+ excretion in colonic transepithelial voltage reflected the function of amiloride-sensitive epithelial Na+ channels.

[3426] It is appreciated that the abovementioned animal model for NR3C2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3427] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3428] Arriza, J. L.; Weinberger, C.; Cerelli, G.; Glaser, T. M.; Handelin, B. L.; Housman, D. E.; Evans, R. M. : Cloning of human mineralocorticoid receptor complementary DNA: structural and functional kinship with the glucocorticoid receptor. Science 237: 268- 275, 1987. ; and

[3429] Berger, S.; Bleich, M.; Schmid, W.; Cole, T. J.; Peters, J.; Watanabe, H.; Kriz, W.; Warth, R.; Greger, R.; Schutz, G. : Mineralocorticoid receptor knockout mice: pathophysiology of Na+.

[3430] Further studies establishing the function and utilities of

NR3C2 are found in John Hopkins OMIM database record ID 600983, and in cited publications listed in Table 5, which are hereby incorporated by reference.Purinergic receptor p2y, g-protein coupled, 2 (P2RY2, Accession NP_002555.2) is another GAM40 target gene, herein designated TARGET GENE. P2RY2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RY2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RY2 BINDING SITE, designated SEQ ID:15265, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3431] Another function of GAM40 is therefore inhibition of Purinergic receptor p2y, g-protein coupled, 2 (P2RY2, Accession NP_002555.2), a gene which mediates cellular responses to ATP. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY2.

[3432] The function of P2RY2 has been established by previous studies. The chloride ion secretory pathway that is defective in cystic fibrosis (OMIM Ref. No. 219700) can be by-

passed by an alternative pathway for chloride ion transport that is activated by extracellular nucleotides. Accordingly, the P2 receptor that mediates this effect is a therapeutic target for improving chloride secretion in CF patients. Parr et al. (1994) reported the sequence and functional expression of a cDNA cloned from human airway epithelial cells that encodes a protein with properties of a P2U nucleotide receptor. With a retrovirus system, the human airway clone was stably expressed in 1321N1 astrocytoma cells, a human cell line unresponsive to extracellular nucleotides. Studies of inositol phosphate accumulation and intracellular Ca(2+) mobilization induced by extracellular nucleotides in 1321N1 cells expressing the receptor identified this clone as the target receptor in human airway epithelia. Parr et al. (1994) also isolated an identical cDNA from human colonic epithelial cells, indicating that this is the same P2U receptor that had been functionally identified in other human tissues. Expression of the human P2U receptor in 1321N1 cells revealed evidence for autocrine ATP release and stimulation of transduced receptors. Thus, P2U expression in the cell line was proposed as a useful system for studying autocrine regulatory mechanisms and for screening potential therapeutic

drugs. Tai et al. (2000) studied the expression and regulation of the P2UR gene in human granulosa- luteal cells (GLCs) by RT- PCR and Northern blot analysis. Expression of P2UR mRNA was downregulated by human chorionic gonadotropin (CG) in a dose- and time- dependent manner. Treatment with 8- bromo- cAMP and forskolin also attenuated P2UR mRNA levels. The authors concluded that the P2UR mRNA is expressed in human GLCs and that P2UR mRNA is regulated by human CG, cAMP, and forskolin. These findings further supported a potential role of this neurotransmitter receptor in the human ovary.

[3433]

[3434] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3435] Parr, C. E.; Sullivan, D. M.; Paradiso, A. M.; Lazarowski, E. R.; Burch, L. H.; Olsen, J. C.; Erb, L.; Weisman, G. A.; Boucher, R. C.; Turner, J. T. : Cloning and expression of a human P(2U) nucleotide receptor, a target for cystic fibrosis pharmacotherapy. Proc. Nat. Acad. Sci. 91: 3275-3279, 1994. ; and

P2U- purinergic receptor in human granulosa- luteal cells. J. Clin. End.

[3437] Further studies establishing the function and utilities of P2RY2 are found in John Hopkins OMIM database record ID 600041, and in cited publications listed in Table 5, which are hereby incorporated by reference.Purinergic receptor p2y, g-protein coupled, 2 (P2RY2, Accession NP_788086.1) is another GAM40 target gene, herein designated TARGET GENE. P2RY2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RY2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RY2 BINDING SITE, designated SEQ ID:15265, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3438] Another function of GAM40 is therefore inhibition of Purinergic receptor p2y, g-protein coupled, 2 (P2RY2, Accession NP_788086.1), a gene which mediates cellular responses to ATP. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY2.

[3439] The function of P2RY2 has been established by previous studies. The chloride ion secretory pathway that is defective in cystic fibrosis (OMIM Ref. No. 219700) can be bypassed by an alternative pathway for chloride ion transport that is activated by extracellular nucleotides. Accordingly, the P2 receptor that mediates this effect is a therapeutic target for improving chloride secretion in CF patients. Parr et al. (1994) reported the sequence and functional expression of a cDNA cloned from human airway epithelial cells that encodes a protein with properties of a P2U nucleotide receptor. With a retrovirus system, the human airway clone was stably expressed in 1321N1 astrocytoma cells, a human cell line unresponsive to extracellular nucleotides. Studies of inositol phosphate accumulation and intracellular Ca(2+) mobilization induced by extracellular nucleotides in 1321N1 cells expressing the receptor identified this clone as the target receptor in human airway epithelia. Parr et al. (1994) also isolated an identical cDNA from human colonic epithelial cells, indicating that this is the same P2U receptor that had been functionally identified in other human tissues. Expression of the human P2U receptor in 1321N1 cells revealed evidence for autocrine ATP release and stimulation of trans-

duced receptors. Thus, P2U expression in the cell line was proposed as a useful system for studying autocrine regulatory mechanisms and for screening potential therapeutic drugs. Tai et al. (2000) studied the expression and regulation of the P2UR gene in human granulosa- luteal cells (GLCs) by RT- PCR and Northern blot analysis. Expression of P2UR mRNA was downregulated by human chorionic gonadotropin (CG) in a dose- and time- dependent manner. Treatment with 8- bromo- cAMP and forskolin also attenuated P2UR mRNA levels. The authors concluded that the P2UR mRNA is expressed in human GLCs and that P2UR mRNA is regulated by human CG, cAMP, and forskolin. These findings further supported a potential role of this neurotransmitter receptor in the human ovary.

[3440]

[3441] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3442] Parr, C. E.; Sullivan, D. M.; Paradiso, A. M.; Lazarowski, E. R.; Burch, L. H.; Olsen, J. C.; Erb, L.; Weisman, G. A.; Boucher, R. C.; Turner, J. T. : Cloning and expression of a human P(2U) nucleotide receptor, a target for cystic fibrosis pharmacotherapy. Proc. Nat. Acad. Sci. 91: 3275-

3279, 1994. ; and

[3444] Further studies establishing the function and utilities of P2RY2 are found in John Hopkins OMIM database record ID 600041, and in cited publications listed in Table 5, which are hereby incorporated by reference.Purinergic receptor p2y, g-protein coupled, 2 (P2RY2, Accession NP_788085.1) is another GAM40 target gene, herein designated TARGET GENE. P2RY2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RY2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RY2 BINDING SITE, designated SEQ ID:15265, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3445] Another function of GAM40 is therefore inhibition of Purinergic receptor p2y, g-protein coupled, 2 (P2RY2, Accession NP_788085.1), a gene which mediates cellular re-

sponses to ATP. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY2.

[3446] The function of P2RY2 has been established by previous studies. The chloride ion secretory pathway that is defective in cystic fibrosis (OMIM Ref. No. 219700) can be bypassed by an alternative pathway for chloride ion transport that is activated by extracellular nucleotides. Accordingly, the P2 receptor that mediates this effect is a therapeutic target for improving chloride secretion in CF patients. Parr et al. (1994) reported the sequence and functional expression of a cDNA cloned from human airway epithelial cells that encodes a protein with properties of a P2U nucleotide receptor. With a retrovirus system, the human airway clone was stably expressed in 1321N1 astrocytoma cells, a human cell line unresponsive to extracellular nucleotides. Studies of inositol phosphate accumulation and intracellular Ca(2+) mobilization induced by extracellular nucleotides in 1321N1 cells expressing the receptor identified this clone as the target receptor in human airway epithelia. Parr et al. (1994) also isolated an identical cDNA from human colonic epithelial cells, indicating that this is the same P2U receptor that had been

functionally identified in other human tissues. Expression of the human P2U receptor in 1321N1 cells revealed evidence for autocrine ATP release and stimulation of transduced receptors. Thus, P2U expression in the cell line was proposed as a useful system for studying autocrine regulatory mechanisms and for screening potential therapeutic drugs. Tai et al. (2000) studied the expression and regulation of the P2UR gene in human granulosa- luteal cells (GLCs) by RT- PCR and Northern blot analysis. Expression of P2UR mRNA was downregulated by human chorionic gonadotropin (CG) in a dose- and time- dependent manner. Treatment with 8- bromo- cAMP and forskolin also attenuated P2UR mRNA levels. The authors concluded that the P2UR mRNA is expressed in human GLCs and that P2UR mRNA is regulated by human CG, cAMP, and forskolin. These findings further supported a potential role of this neurotransmitter receptor in the human ovary.

[3447]

[3448] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3449] Parr, C. E.; Sullivan, D. M.; Paradiso, A. M.; Lazarowski, E. R.; Burch, L. H.; Olsen, J. C.; Erb, L.; Weisman, G. A.;

[3450] Tai, C.- J.; Kang, S. K.; Cheng, K. W.; Choi, K.- C.; Nathwani, P. S.; Leung, P. C. K. : Expression and regulation of P2U- purinergic receptor in human granulosa- luteal cells. J. Clin. End.

[3451] Further studies establishing the function and utilities of P2RY2 are found in John Hopkins OMIM database record ID 600041, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired box gene 5 (b-cell lineage specific activator protein) (PAX5, Accession NP_057953.1) is another GAM40 target gene, herein designated TARGET GENE. PAX5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PAX5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX5 BINDING SITE, designated SEQ ID:1514, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3452] Another function of GAM40 is therefore inhibition of Paired box gene 5 (b-cell lineage specific activator protein) (PAX5, Accession NP_057953.1), a gene which plays a role in B- cell differentiation, neural development and spermatogenesis and therefore may be associated with Human primary immunodeficiencies. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of Human primary immunodeficiencies, and of other diseases and clinical conditions associated with PAX5.

[3453] The function of PAX5 has been established by previous studies. The PAX5 gene is located in the 9p13 region, which is involved in t(9;14)(p13;q32) translocations recurring in small lymphocytic lymphomas of the plasmacytoid subtype and in derived large cell lymphomas. Ohno et al. (1990) showed that in a diffuse large cell lymphoma (KIS-1) with a translocation, the immunoglobulin heavy- chain (IgH) locus on 14q32 is juxtaposed to 9p13 sequences of unknown function. Busslinger et al. (1996) showed that the KIS- 1 translocation breakpoint is located 1,807 bp upstream of exon 1A of PAX5, thus bringing the potent E-mu enhancer of the IgH gene into close proximity with the PAX5 promoters. The data suggested to them that deregulation of PAX5 gene transcription by the t(9;14) translo-

cation contributes to the pathogenesis of small lymphocytic lymphomas with plasmacytoid differentiation. In addition to immunoglobulin V genes, the 5- prime sequences of BCL6 (OMIM Ref. No. 109565) and FAS (TNFRSF6; 134637) are mutated in normal germinal center B lymphocytes. Genomic instability promotes tumorigenesis through defective chromosome segregation and DNA mismatch repair inactivation. By screening 18 loci for mutations, Pasqualucci et al. (2001) identified changes in the germline sequences of PIM1 (OMIM Ref. No. 164960), MYC (OMIM Ref. No. 190080), ARHH (OMIM Ref. No. 602037), and/or PAX5, in addition to BCL6, in a majority of diffuse large cell lymphomas (DLCLs; OMIM Ref. No. 601889). No mutations in PIM1, MYC, ARHH, and PAX5 were detected in germinal- center lymphocytes, naive B cells, or B- cell malignancies other than DLCLs. PAX5 mutations, which were observed in 57% of DLCLs, were identified downstream of both transcription sites, predominantly in noncoding sequences around exon 1B. FISH analysis indicated that hypermutation in these genes is not due to chromosomal translocation, as seen in Burkitt lymphoma (OMIM Ref. No. 113970). Chromosomal translocation, however, may be an outcome of hypermutation. Specific features of

the hypermutation process, including the predominance of single nucleotide substitutions with occasional deletions or duplications, a preference for transitions over transversions, and a specific motif targeting RGYW, were recognizable in each of the hypermutated loci. Pasqualucci et al. (2001) proposed that aberrant hypermutation of regulatory and coding sequences of genes that do not represent physiologic targets may provide the basis for DLCL pathogenesis and explain its phenotypic and clinical heterogeneity. This hypermutation malfunction is unlikely to be due to defective DNA mismatch repair and does not appear to involve activation- induced deaminase (AICDA; 605257)

[3454] Animal model experiments lend further support to the function of PAX5. Nutt et al. (1999) demonstrated that pro- B cells lacking Pax5 are incapable of in vitro B- cell differentiation unless Pax5 expression is restored by retroviral transduction. Pax5 - /- pro- B cells are not restricted in their lineage fate, as stimulation with appropriate cytokines induces them to differentiate into functional macrophages, osteoclasts, dendritic cells, granulocytes, and natural killer cells. As expected for a clonogenic hematopoietic progenitor with lymphomyeloid develop-

mental potential, the Pax5 - /- pro- B cell expresses genes of different lineage- affiliated programs, and restoration of Pax5 activity represses this lineage- promiscuous transcription. Pax5 therefore plays an essential role in B- lineage commitment by suppressing alternative lineage choices. Differentiation of the hematopoietic stem cell into distinct blood cell types was thought to progress through intermediate progenitor cells with restricted developmental potential. This view of hematopoiesis was challenged by the findings of Nutt et al. (1999) that the Pax5 - /- pro- B cell possesses, at least under in vitro conditions, a broad, developmental potential similar to that of the hematopoietic stem cell itself. However, Pax5 - /- pro- B cells are unable to differentiate along the erythroid and megakaryocytic lineages, and cannot reconstitute the entire hematopoietic system under transplantation experiments. Therefore, Nutt et al. (1999) concluded that the Pax5 - /- pro- B cell must be classified as a hematopoietic progenitor cell with broad lymphoid and myeloid differentiation potential. Nutt et al. (1999) also concluded that their data supported the notion that B- lineage commitment is a stochastic rather than a deterministic process.

[3455] It is appreciated that the abovementioned animal model for PAX5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3456] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3457] Pasqualucci, L.; Neumeister, P.; Goossens, T.; Nanjangud, G.; Chaganti, R. S. K.; Kuppers, R.; Dalla- Favera, R. : Hypermutation of multiple proto- oncogenes in B- cell diffuse large- cell lymphomas. Nature 412: 341- 346, 2001. ; and

[3458] Nutt, S. L.; Heavey, B.; Rolink, A. G.; Busslinger, M. : Commitment to the B- lymphoid lineage depends on the transcription factor Pax5. Nature 401: 556- 562, 1999.

[3459] Further studies establishing the function and utilities of PAX5 are found in John Hopkins OMIM database record ID 167414, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pancreatic polypeptide receptor 1 (PPYR1, Accession NP_005963.1) is another GAM40 target gene, herein designated TARGET GENE. PPYR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPYR1,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPYR1 BINDING SITE, designated SEQ ID:4618, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3460] Another function of GAM40 is therefore inhibition of Pancreatic polypeptide receptor 1 (PPYR1, Accession NP_005963.1), a gene which binds (from highest to lowest affinity) PP, PYY, and NPY hormones. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPYR1.

[3461] The function of PPYR1 has been established by previous studies. Pancreatic polypeptide (PP; 167780), neuropeptide Y (NPY; 162640) and peptide YY (PYY; 600781) are related 36- amino acid hormones. A number of structurally related receptors for these peptides have been isolated (e.g., NPY2R; 162642). Bard et al. (1995) used the rat Y1 receptor (NPY1R; 162641) as a probe to clone a novel receptor, PPYR1 (termed Y4 by them), from a human genomic DNA library. PPYR1 is an intronless gene that encodes a predicted 375- amino acid polypeptide having highest homology to the Y1 receptor gene (42% amino

acid identity). Using RT- PCR, they showed that the PPYR1 receptor is expressed in several human tissues, including brain, coronary artery, and ileum. Bard et al. (1995) expressed the PPYR1 gene in COS- 7 cells and performed a hormone- binding assay which showed that the PPYR1 receptor binds (from highest to lowest affinity) PP, PYY, and NPY hormones. The genes encoding NPY1R and NPY2R have been mapped to 4q31.3- q32 and 4q31, respectively. They are located approximately 6 cM apart and have been mapped to conserved syntenic linkage groups on mouse chromosome 8 and 3, respectively. The human type 5 receptor (NPY5R; 602001) is also thought to be located on 4q31- q32; part of its sequence is nearly identical to, but in the opposite orientation from, that of the Y1 receptor sequence. To determine whether all functional human NPY receptor genes are clustered on chromosome 4, Lutz et al. (1997) mapped PPYR1 and NPY5R using somatic cell hybrids. They found that PPYR1 maps to chromosome 10. For regionalization, they used mapping to a YAC library using PCR and the primers for the PPYR1 gene. Their findings suggested that 10q11.2- q21.2 is the likely cytogenetic location of PPYR1. Lutz et al. (1997) mapped the Ppyr1 gene to mouse chromosome 14, approximately

15 cM from the centromere.

[3462]

[3463] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3464] Bard, J. A.; Walker, M. W.; Branchek, T. A.; Weinshank, R. L. : Cloning and functional expression of a human Y4 subtype receptor for pancreatic polypeptide, neuropeptide Y, and peptide YY J. Biol. Chem 270: 26762- 26765, 1995. ; and

[3465] Lutz, C. M.; Richards, J. E.; Scott, K. L.; Sinha, S.; Yang-Feng, T. L.; Frankel, W. N.; Thompson, D. A. : Neuropeptide Y receptor genes mapped in human and mouse: receptors with high af.

[3466] Further studies establishing the function and utilities of PPYR1 are found in John Hopkins OMIM database record ID 601790, and in cited publications listed in Table 5, which are hereby incorporated by reference.Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NP_000953.2) is another GAM40 target gene, herein designated TARGET GENE. PTGS1 BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by PTGS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE, designated SEQ ID:11891, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3467] Another function of GAM40 is therefore inhibition of Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NP_000953.2), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1.

[3468] The function of PTGS1 has been established by previous studies. Prostaglandin H2 synthase is known to pharmacologists (Vane et al., 1994) as cyclooxygenase (COX), and its 2 isoforms are known as COX1 and COX2. Vane et al. (1994) outlined the actions of the 2 isoforms of COX. Stemming from this outline was a hypothesis that the therapeutic effects of drugs such as aspirin are due to inhibition of COX2, whereas the unwanted side- effects (and

the action on platelets) result from inhibition of COX1. Prostaglandin- endoperoxide synthase (PTGS; EC 1.14.99.1; fatty acid cyclooxygenase; PGH synthase) is the key enzyme in prostaglandin biosynthesis. The cyclooxygenase activity of the enzyme is inhibited by nonsteroidal antiinflammatory drugs such as aspirin and endomethacin.

[3469] Animal model experiments lend further support to the function of PTGS1. To study the separate roles of the 2 isoforms of cyclooxygenase, Langenbach et al. (1995) used homologous recombination to disrupt the mouse Ptgs1 gene encoding COX1. Homozygous Ptgs1 mutant mice survived well, had no gastric pathology, and showed less indomethacin- induced gastric ulceration than wild-type mice, even though their gastric prostaglandin E2 levels were about 1% of wildtype. Homozygous mutant mice had reduced platelet aggregation and a decreased inflammatory response to arachidonic acid, but not to tetradecanoyl phorbol acetate. Ptgs1 homozygous mutant females mated to homozygous mutant males produced few live offspring. Langenbach et al. (1995) stated that COX1-deficient mice provided a useful model for distinguishing the physiologic roles of the 2 cyclooxygenases, COX1 and

COX2.

[3470] It is appreciated that the abovementioned animal model for PTGS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3471] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3472] Vane, J. R.; Mitchell, J. A.; Appleton, I.; Tomlinson, A.; Bishop- Bailey, D.; Croxtall, J.; Willoughby, D. A. : Inducible isoforms of cyclooxygenase and nitric- oxide synthase in inflammation. Proc. Nat. Acad. Sci. 91: 2046-2050, 1994. ; and

[3474] Further studies establishing the function and utilities of PTGS1 are found in John Hopkins OMIM database record ID 176805, and in cited publications listed in Table 5, which are hereby incorporated by reference.Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1,

Accession NP_542158.1) is another GAM40 target gene, herein designated TARGET GENE. PTGS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTGS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE, designated SEQ ID:11891, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3475] Another function of GAM40 is therefore inhibition of Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NP_542158.1), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1.

[3476] The function of PTGS1 has been established by previous studies. Prostaglandin H2 synthase is known to pharmacologists (Vane et al., 1994) as cyclooxygenase (COX), and its 2 isoforms are known as COX1 and COX2. Vane et al. (1994) outlined the actions of the 2 isoforms of COX.

Stemming from this outline was a hypothesis that the therapeutic effects of drugs such as aspirin are due to inhibition of COX2, whereas the unwanted side- effects (and the action on platelets) result from inhibition of COX1. Prostaglandin- endoperoxide synthase (PTGS; EC 1.14.99.1; fatty acid cyclooxygenase; PGH synthase) is the key enzyme in prostaglandin biosynthesis. The cyclooxygenase activity of the enzyme is inhibited by nonsteroidal antiinflammatory drugs such as aspirin and endomethacin.

[3477] Animal model experiments lend further support to the function of PTGS1. To study the separate roles of the 2 isoforms of cyclooxygenase, Langenbach et al. (1995) used homologous recombination to disrupt the mouse Ptgs1 gene encoding COX1. Homozygous Ptgs1 mutant mice survived well, had no gastric pathology, and showed less indomethacin- induced gastric ulceration than wild-type mice, even though their gastric prostaglandin E2 levels were about 1% of wildtype. Homozygous mutant mice had reduced platelet aggregation and a decreased inflammatory response to arachidonic acid, but not to tetradecanoyl phorbol acetate. Ptgs1 homozygous mutant females mated to homozygous mutant males produced few

live offspring. Langenbach et al. (1995) stated that COX1-deficient mice provided a useful model for distinguishing the physiologic roles of the 2 cyclooxygenases, COX1 and COX2.

[3478] It is appreciated that the abovementioned animal model for PTGS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3479] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3480] Vane, J. R.; Mitchell, J. A.; Appleton, I.; Tomlinson, A.; Bishop- Bailey, D.; Croxtall, J.; Willoughby, D. A. : Inducible isoforms of cyclooxygenase and nitric- oxide synthase in inflammation. Proc. Nat. Acad. Sci. 91: 2046-2050, 1994. ; and

[3481] Langenbach, R.; Morham, S. G.; Tiano, H. F.; Loftin, C. D.; Ghanayem, B. I.; Chulada, P. C.; Mahler, J. F.; Lee, C. A.; Goulding, E. H.; Kluckman, K. D.; Kim, H. S.; Smithies, O. : Prost.

[3482] Further studies establishing the function and utilities of PTGS1 are found in John Hopkins OMIM database record ID 176805, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Rna binding motif protein 7 (RBM7, Accession NP_057174.1) is another GAM40 target gene, herein designated TARGET GENE. RBM7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBM7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBM7 BINDING SITE, designated SEQ ID:651, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3483] Another function of GAM40 is therefore inhibition of Rna binding motif protein 7 (RBM7, Accession NP_057174.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM7.

[3484] Regulator of g-protein signalling 5 (RGS5, Accession NP_003608.1) is another GAM40 target gene, herein designated TARGET GENE. RGS5 BINDING SITE1 and RGS5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by RGS5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of RGS5 BINDING SITE1 and RGS5 BINDING SITE2, designated SEQ ID:7379 and SEQ ID:12110 respectively, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3485] Another function of GAM40 is therefore inhibition of Regulator of g-protein signalling 5 (RGS5, Accession NP_003608.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS5.

[3486] RNAH (Accession NP_006819.1) is another GAM40 target gene, herein designated TARGET GENE. RNAH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNAH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNAH BINDING SITE, designated SEQ ID:4545, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3487] Another function of GAM40 is therefore inhibition of RNAH (Accession NP_006819.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with RNAH.

[3488] Ribosomal protein l15 (RPL15, Accession NP_002939.2) is another GAM40 target gene, herein designated TARGET GENE. RPL15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPL15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPL15 BINDING SITE, designated SEQ ID:14209, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3489] Another function of GAM40 is therefore inhibition of Ribosomal protein l15 (RPL15, Accession NP_002939.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL15.

[3490] SCOTIN (Accession NP_057563.3) is another GAM40 target gene, herein designated TARGET GENE. SCOTIN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCOTIN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCOTIN

BINDING SITE, designated SEQ ID:13969, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3491] Another function of GAM40 is therefore inhibition of SCOTIN (Accession NP_057563.3) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCOTIN.

[3492] SEC15L (Accession NP_061926.2) is another GAM40 target gene, herein designated TARGET GENE. SEC15L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEC15L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEC15L BINDING SITE, designated SEQ ID:870, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3493] Another function of GAM40 is therefore inhibition of SEC15L (Accession NP_061926.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15L.

[3494] Secreted frizzled-related protein 1 (SFRP1, Accession NP_003003.2) is another GAM40 target gene, herein des-

ignated TARGET GENE. SFRP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFRP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:597, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3495] Another function of GAM40 is therefore inhibition of Secreted frizzled-related protein 1 (SFRP1, Accession NP_003003.2), a gene which is a receptor for wnt proteins that may have an anti- apoptotic function and therefore may be associated with Colorectal cancer, gastric cancer, uterine leiomyomas. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of Colorectal cancer, gastric cancer, uterine leiomyomas, and of other diseases and clinical conditions associated with SFRP1.

[3496] The function of SFRP1 has been established by previous studies. A frequent epigenetic change in cancer involves aberrantly hypermethylated CpG islands in gene promoters, with loss of transcription of the genes (Baylin and Herman, (2000)) Cameron et al. (1999) showed that silencing of hypermethylated genes in cancer is dependent

on both methylation of dense CpG islands and histone deacetylase (see OMIM Ref. No. 601241) activity. Suzuki et al. (2002) used cDNA microarray analysis to screen for genes that are epigenetically silenced in human colorectal cancer. By screening over 10,000 genes, they showed that they could identify a substantial number of genes with promoter hypermethylation in a given cancer; these are distinct from genes with unmethylated promoters, for which increased expression is produced by histone deacetylase inhibition alone. Many of the hypermethylated genes identified have high potential for roles in tumorigenesis by virtue of their predicted function and chromosome position. They also identified a group of genes that are preferentially hypermethylated in colorectal cancer and gastric cancer. One of these genes, SFRP1, belongs to a gene family; Suzuki et al. (2002) showed that hypermethylation of 4 genes in this family occur frequently in colorectal cancer, providing for (i) a unique potential mechanism for loss of tumor suppressor gene function and (ii) construction of a molecular marker panel that could detect virtually all colorectal cancer. Fukuhara et al. (2002) investigated the expression and function of SFRP1 in uterine leiomyomas. Northern and Western blot analyses de-

tected increased SFRP1 expression in leiomyomas compared with normal myometrium. Expression was strongest in the late follicular phase (high estrogenic milieu) of the menstrual cycle. Interestingly, expression was negligible in leiomyomas treated with GNRH agonist. They authors concluded that strong SFRP1 expression, which appeared to be independent of cell proliferation, under high estrogenic conditions contributes to the development of uterine leiomyomas through the antiapoptotic effect of SFRP1.

[3497]

[3498] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3500] Fukuhara, K.; Kariya, M.; Kita, M.; Shime, H.; Kanamori, T.; Kosaka, C.; Orii, A.; Fujita, J.; Fujii, S. : Secreted frizzled related protein 1 is overexpressed in uterine leiomyomas, ass.

[3501] Further studies establishing the function and utilities of

SFRP1 are found in John Hopkins OMIM database record ID 604156, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sideroflexin 1 (SFXN1, Accession NP_073591.2) is another GAM40 target gene, herein designated TARGET GENE. SFXN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFXN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFXN1 BINDING SITE, designated SEQ ID:1452, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3502] Another function of GAM40 is therefore inhibition of Sideroflexin 1 (SFXN1, Accession NP_073591.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN1.

[3503] Solute carrier family 1 (neutral amino acid transporter), member 5 (SLC1A5, Accession NP_005619.1) is another GAM40 target gene, herein designated TARGET GENE. SLC1A5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC1A5, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC1A5 BINDING SITE, designated SEQ ID:6435, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3504] Another function of GAM40 is therefore inhibition of Solute carrier family 1 (neutral amino acid transporter), member 5 (SLC1A5, Accession NP_005619.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A5.

[3505] Solute carrier family 9 (sodium/hydrogen exchanger), isoform 6 (SLC9A6, Accession NP_006350.1) is another GAM40 target gene, herein designated TARGET GENE. SLC9A6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC9A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC9A6 BINDING SITE, designated SEQ ID:8100, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3506] Another function of GAM40 is therefore inhibition of Solute carrier family 9 (sodium/hydrogen exchanger), isoform 6 (SLC9A6, Accession NP_006350.1), a gene which is involved electroneutral exchange of protons for na+ and k+ across the mitochondrial inner membrane. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A6.

[3507] The function of SLC9A6 has been established by previous studies. By searching sequence databases for proteins with sequence similarity to the S. cerevisiae mitochondrial sodium/hydrogen exchanger Nha2, Numata et al. (1998) identified the deduced protein product of the KIAA0267 cDNA (Nagase et al., 1996), SLC9A6. The KIAA0267- encoded protein shares 30% amino acid sequence identity with S. cerevisiae Nha2, and approximately 20 to 24% identity with the mammalian NHE isoforms NHE1 to NHE5 (see OMIM Ref. No. SLC9A5; 600477). Numata et al. (1998), who concluded that the KIAA0267 cDNA lacks 5-prime coding sequence, isolated a human cDNA containing the complete coding sequence of SLC9A6, which they called NHE6. The deduced 669- amino acid SLC9A6 protein has 12 putative membrane- spanning segments

within the N- terminal region, and a hydrophilic C terminus, similar to the topologies predicted for other NHEs. In addition, SLC9A6 has a putative mitochondrial inner membrane targeting signal at its N terminus. Northern blot analysis detected an approximately 5.5- kb SLC9A6 transcript that was ubiquitously expressed, with the most abundant expression in mitochondrion- rich tissues such as brain, skeletal muscle, and heart. Fluorescence microscopy suggested that SLC9A6 localizes to mitochondria. Numata et al. (1998) deleted the S. cerevisiae NHA2 gene by homologous disruption and found that benzamil-inhibitable, acid- activated sodium uptake into mitochondria was abolished in the mutant strain. The mutant strain also showed retarded growth on nonfermentable carbon sources and severely reduced survival during the stationary phase of the cell cycle compared with the parental strain, consistent with a defect in aerobic metabolism. The authors suggested that Nha2 and SLC9A6 are homologous sodium/hydrogen exchangers that are important for mitochondrial function.

Note: Supplement: DNA Res. 3: 341-354, 1996. ; and

[3511] Numata, M.; Petrecca, K.; Lake, N.; Orlowski, J. : Identification of a mitochondrial Na+/H+ exchanger. J. Biol. Chem. 273: 6951- 6959, 1998.

[3512] Further studies establishing the function and utilities of SLC9A6 are found in John Hopkins OMIM database record ID 300231, and in cited publications listed in Table 5, which are hereby incorporated by reference.SMAP-1 (Accession NP_061141.2) is another GAM40 target gene, herein designated TARGET GENE. SMAP-1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMAP-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of SMAP-1 BINDING SITE, designated SEQ ID:11457, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3513] Another function of GAM40 is therefore inhibition of SMAP-1 (Accession NP_061141.2) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAP-1.

[3514] Sperm associated antigen 4 (SPAG4, Accession NP_003107.1) is another GAM40 target gene, herein designated TARGET GENE. SPAG4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SPAG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPAG4 BINDING SITE, designated SEQ ID:7992, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3515] Another function of GAM40 is therefore inhibition of Sperm associated antigen 4 (SPAG4, Accession NP_003107.1), a gene which predicted ortholog of rat SPAG4which interacts with rat ODF27, the 27kDa outer dense fiber protein. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with SPAG4.

[3516] The function of SPAG4 has been established by previous studies. Mammalian sperm tails contain, besides an axoneme, 2 unique components: outer dense fibers (ODF), which extend along the entire tail, and a fibrous sheath (FS), which initiates at the stack of mitochondria and surrounds the ODF until the end of the sperm tail. Defects in these structures have been associated with reduced sperm tail motility and human infertility. Early studies indicated that ODF proteins are testis- specific and are synthesized in elongating spermatids. One ODF gene, ODF27 (ODF1; 182878), was cloned by van der Hoorn et al. (1990) and others. Shao and van der Hoorn (1996) used a yeast 2-hybrid screening with the leucine zipper region of ODF27 as bait to isolate rat testis- specific proteins that could interact with ODF27 (Shao et al., 1997). One of the novel genes encoded the major 84- kD ODF protein (OMIM Ref. No. 602015), the human homolog of which maps to 9q34. Another of the new genes, SPAG4, also encoded a product that interacted strongly with ODF27 via a leucine zipper and was expressed exclusively, although transiently, in elongating spermatids; protein synthesis of SPAG4 was maximal during maximal ODF27 synthesis and growth of

the sperm tail. However, the product of the SPAG4 gene was not incorporated into the mature sperm tail. Tarnasky et al. (1998) cloned the human SPAG4 homolog and by fluorescence in situ hybridization demonstrated that the gene maps to 20q11.

[3517]

[3518] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3519] Shao, X.; van der Hoorn, F. A. : Self- interaction of the major 27- kilodalton outer dense fiber protein is in part mediated by a leucine zipper domain in the rat. Biol. Reprod. 55: 1343- 1350, 1996. ; and

[3520] Tarnasky, H.; Gill, D.; Murthy, S.; Shao, X.; Demetrick, D. J.; van der Hoorn, F. A. : A novel testis- specific gene, SPAG4, whose product interacts specifically with outer dense fiber pr.

[3521] Further studies establishing the function and utilities of SPAG4 are found in John Hopkins OMIM database record ID 603038, and in cited publications listed in Table 5, which are hereby incorporated by reference.Toll-like receptor 5 (TLR5, Accession NP_003259.2) is another GAM40 target gene, herein designated TARGET GENE.

TLR5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TLR5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TLR5 BINDING SITE, designated SEQ ID:9677, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3522] Another function of GAM40 is therefore inhibition of Toll-like receptor 5 (TLR5, Accession NP_003259.2), a gene which participates in the innate immune response to bacterial flagellins. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLR5.

[3523] The function of TLR5 has been established by previous studies. By searching an EST database for human Toll homologs, Chaudhary et al. (1998) identified cDNA sequences from 2 genes that they called TIL3 and TIL4 (TLR2; 603028). Muzio et al. (2000) determined the differential expression pattern of the TLRs in leukocytes. Like TLR2 and TLR4, TLR5 was expressed in myelomonocytic cells, but at lower levels. Hayashi et al. (2001) showed that expression of TLR5 induces NF- kappa- B ac-

tivation and TNFA (OMIM Ref. No. 191160) production. Pathogen- associated molecular patterns (PAMPs) known to stimulate other TLR family members failed to stimulate TLR5; however, luciferase reporter assays indicated TLR5 activation in gram- positive and - negative bacterial culture supernatants. By fractionation of Listeria culture supernatants followed by SDS- PAGE, Hayashi et al. (2001) identified flagellin as the TLR5 ligand. Flagellin, a principal component of bacterial flagella, is a virulence factor recognized by the innate immune system in plants, insects, and mammals. Expression of flagellin in nonflagellated bacteria resulted in TLR5 activation, and deletion of flagellin from flagellated bacteria abrogated TLR5 activation. Hayashi et al. (2001) demonstrated that injection of flagellin induces the production of IL6 (OMIM Ref. No. 147620) in wildtype mice, but not in those lacking the MyD88 (OMIM Ref. No. 602170) adaptor protein, required for TLR signaling. Hayashi et al. (2001) concluded that TLR5 is a pattern- recognition receptor and that its PAMP is flagellin, a protein with conserved N and C termini in a broad group of motile pathogens.

[3524]

[3525] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[3528] Further studies establishing the function and utilities of TLR5 are found in John Hopkins OMIM database record ID 603031, and in cited publications listed in Table 5, which are hereby incorporated by reference.Translocase of outer mitochondrial membrane 70 homolog a (yeast) (TOMM70A, Accession NP_055635.1) is another GAM40 target gene, herein designated TARGET GENE. TOMM70A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TOMM70A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:14026, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3529] Another function of GAM40 is therefore inhibition of Translocase of outer mitochondrial membrane 70 homolog a (yeast) (TOMM70A, Accession NP_055635.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM70A.

[3530] Tnfrsf1a-associated via death domain (TRADD, Accession NP_003780.1) is another GAM40 target gene, herein designated TARGET GENE. TRADD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRADD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRADD BINDING SITE, designated SEQ ID:9944, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3531] Another function of GAM40 is therefore inhibition of Tnfrsf1a-associated via death domain (TRADD, Accession

NP_003780.1), a gene which specifically interacts with the cytoplasmic domain of activated tnfr1. interacts with trafs (traf1 and traf2), fadd and rip. acts as an adaptor molecule for tnfr1 mediating its interaction with fadd. overexpression of tradd leads to two major tnf- induced responses, apoptosis and activation of nf- kappa b. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRADD.

[3532] The function of TRADD has been established by previous studies. Many diverse activities of tumor necrosis factor (TNF) are signaled through TNF receptor- 1 (TNFR1; 191190). TNFR1 contains an intracellular death domain (see OMIM Ref. No. DR3; 603366) that is required for signaling antiviral activity, programmed cell death, and NF-kappa- B (OMIM Ref. No. 164011) activation. TNF- induced apoptosis involves activation of the ICE cysteine protease (OMIM Ref. No. 147678). By using a yeast 2- hybrid screen to identify proteins that interact with the death domain of TNFR1, Hsu et al. (1995) isolated cDNAs encoding a 34- kD protein that they designated TRADD (TNFR1- associated death domain protein). Overexpression of TRADD led to 2 major TNF- induced responses,

apoptosis and activation of NF- kappa- B. The predicted 312- amino acid TRADD protein contains a 111- amino acid death domain with sequence similarity to that of TNFR1. This region of TRADD is capable of mediating TRADD oligomerization, TNFR1 interaction, stimulation of apoptosis, and NF- kappa- B activation. TRADD- mediated cell death can be suppressed by expression of the cowpox virus crmA gene, which encodes an inhibitor of ICE. However, crmA expression does not inhibit NF- kappa- B activation by TRADD, demonstrating that the 2 signaling pathways emanating from TRADD are distinct. Northern blot analysis revealed that the 1.4- kb TRADD mRNA is expressed ubiquitously. Park et al. (2000) determined the crystal structure of the complex between the N- terminal domain of TRADD (residues 1 to 169) and the TRAF domain of TRAF2 (601895; residues 327 to 501) at 2.0- angstrom resolution. The structure revealed a novel mode of interaction mediated by a relatively extensive protein- protein interface. Pan et al. (1996) isolated the mouse Tradd gene and found that it contains 4 exons and spans less than 7 kb. The predicted mouse and human TRADD proteins are 75% identical. By analysis of an interspecific backcross, they mapped the Tradd gene to the

distal region of mouse chromosome 8, in a region showing homology of synteny to human chromosome 16q22. By FISH, Scheuerpflug et al. (2001) mapped the human TRADD gene to chromosome 16q22.

[3533]

[3534] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3535] Park, Y. C.; Ye, H.; Hsia, C.; Segal, D.; Rich, R. L.; Liou, H.-C.; Myszka, D. G.; Wu, H. : A novel mechanism of TRAF signaling revealed by structural and functional analyses of the TRADD- TRAF2 interaction. Cell 101: 777- 787, 2000. ; and

By analysis of an interspecific backcross, they mapped the Tradd gene to the distal region of mouse chromosome 8, in a region showing homology of synteny to human chromosome 16q22. By FISH, Scheuerpflug et al. (2001) mapped the human TRADD gene to chromosome 16q22.

[3540]

[3541] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3542] Park, Y. C.; Ye, H.; Hsia, C.; Segal, D.; Rich, R. L.; Liou, H.-C.; Myszka, D. G.; Wu, H. : A novel mechanism of TRAF signaling revealed by structural and functional analyses of the TRADD- TRAF2 interaction. Cell 101: 777- 787, 2000.

; and

[3543] Scheuerpflug, C. G.; Lichter, P.; Debatin, K.- M.; Mincheva, A. : Assignment of TRADD to human chromosome band 16q22 by in situ hybridization. Cytogenet. Cell Genet. 92: 347- 348, 2001.

[3544] Further studies establishing the function and utilities of TRADD are found in John Hopkins OMIM database record ID 603500, and in cited publications listed in Table 5, which are hereby incorporated by reference.Winged-helix nude (WHN, Accession NP_003584.2) is another GAM40 target gene, herein designated TARGET GENE. WHN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WHN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WHN BINDING SITE, designated SEQ ID:9862, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3545] Another function of GAM40 is therefore inhibition of Winged-helix nude (WHN, Accession NP_003584.2), a gene which plays a role in transcriptional regulation and therefore may be associated with T- cell immunodefi-

ciency, the skin disorder congenital alopecia, and nail dystrophy. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of T- cell immunodeficiency, the skin disorder congenital alopecia, and nail dystrophy., and of other diseases and clinical conditions associated with WHN.

[3546] The function of WHN has been established by previous studies. In 2 sisters with T- cell immunodeficiency, congenital alopecia, and nail dystrophy (OMIM Ref. No. 601705), Frank et al. (1999) identified a homozygous nonsense mutation in the WHN gene. In mammals, whn expression occurs in epithelial cells of the thymus as well as specific cells of the hair follicle. In the human, WHN is expressed in the differentiating cells of the hair follicle precortex and the innermost cell layer of the outer root sheath. Expression in the thymus was not determine.

[3547] Animal model experiments lend further support to the function of WHN. Mutations at the 'nude' locus of mice and rats disrupt normal hair growth and thymus development, causing nude mice and rats to be immune- deficient. Nehls et al. (1994) showed that a gene designated whn, located in the region of mouse chromosome 11 known to contain the nude locus, encodes a new member

of the winged- helix domain family of transcription factors. The predicted protein is 648 amino acids long. The whn gene was disrupted on the mouse and rat nude alleles. Mutant transcripts did not encode the characteristic DNA- binding domain, strongly suggesting that the whn gene is the nude gene. Mutations in winged- helix domain genes cause homeotic transformations in Drosophila and distort cell- fate decisions during vulval development in C. elegans. The whn gene was thus the first member of this class of genes to be implicated in a specific developmental defect in vertebrates

[3548] It is appreciated that the abovementioned animal model for WHN is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3549] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3552] Further studies establishing the function and utilities of WHN are found in John Hopkins OMIM database record ID 600838, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, gamma polypeptide (YWHAG, Accession NP_036611.2) is another GAM40 target gene, herein designated TARGET GENE. YWHAG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by YWHAG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ ID:19676, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3553] Another function of GAM40 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase

activation protein, gamma polypeptide (YWHAG, Accession NP_036611.2), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAG.

[3554] The function of YWHAG has been established by previous studies. Members of the 14- 3- 3 protein family play an important role in signal transduction leading to mitosis and cellular proliferation (Morrison, 1994). For background information on 14- 3- 3 proteins, see 113508. Autieri et al. (1995, 1996) found that rat 14- 3- 3-gamma (YWHAG) is upregulated in injured rat carotid arteries and that YWHAG mRNA is upregulated in cytokine-stimulated human vascular smooth muscle cells (VSMC). Using PCR primers based on the rat YWHAG sequence to screen human VSMC, Autieri and Carbone (1999) isolated a cDNA encoding YWHAG. The deduced 246- amino acid protein, which shares 98% sequence identity with the rat sequence, has preserved 14- 3- 3 family signature motifs, a predicted annexin motif, and several potential phosphorylation sites but not the CDK2 (OMIM Ref. No. 116953) phosphorylation motif. By EST database searching, Horie

et al. (1999) also obtained a cDNA encoding YWHAG, which they found to be 100% identical to the 247- amino acid rat sequence. Northern blot analysis revealed ubiquitous expression of a 3.8- kb YWHAG transcript that is relatively strong in brain, skeletal muscle, and heart but weak in peripheral blood leukocytes. By SDS- PAGE and autoradiographic analysis, Autieri and Carbone (1999) found that YWHAG is expressed and phosphorylated by activation with platelet- derived growth factor (OMIM Ref. No. 190040) and other activators of several isoforms of protein kinase C (PKC; e.g., 176960). Inhibitors of PKC block YWHAG phosphorylation. Western blot analysis showed that YWHAG interacts with PKC and with RAF1 (OMIM Ref. No. 164760).

[3555]

[3556] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3557] Autieri, M. V.; Carbone, C. J. : 14- 3- 3- Gamma interacts with and is phosphorylated by multiple protein kinase C isoforms in PDGF- stimulated human vascular smooth muscle cells. DNA Cell Biol. 18: 555- 564, 1999. ; and

[3558] Horie, M.; Suzuki, M.; Takahashi, E.; Tanigami, A. :

Cloning, expression, and chromosomal mapping of the human 14- 3- 3gamma gene (YWHAG) to 7q11.23. Genomics 60: 241- 243, 1999.

[3559] Further studies establishing the function and utilities of YWHAG are found in John Hopkins OMIM database record ID 605356, and in cited publications listed in Table 5, which are hereby incorporated by reference.ZNF408 (Accession NP_079017.1) is another GAM40 target gene, herein designated TARGET GENE. ZNF408 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF408 BINDING SITE, designated SEQ ID:14053, to the nucleotide sequence of GAM40 RNA, herein designated GAM RNA, also designated SEQ ID:396.

[3560] Another function of GAM40 is therefore inhibition of ZNF408 (Accession NP_079017.1) . Accordingly, utilities of GAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF408.

[3561]

[3562] Fig. 8 further provides a conceptual description of a novel

bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 41 (GAM41), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[3563] GAM41 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM41 was detected is described hereinabove with reference to Figs. 8-15.

[3564] GAM41 gene, herein designated GAM GENE, and GAM41 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[3565] GAM41 gene encodes a GAM41 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM41 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM41 precursor RNA is designated SEQ ID:13, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:13 is located at position 66039675 relative to chromosome 5.

[3566] GAM41 precursor RNA folds onto itself, forming GAM41 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3567] GAM41 precursor RNA folds onto itself, forming GAM41 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[3568] Nucleotide sequence of GAM41 precursor RNA, designated SEQ-ID: 13, and a schematic representation of a predicted secondary folding of GAM41 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[3569] An enzyme complex designated DICER COMPLEX, `dices` the GAM41 folded precursor RNA into GAM41 RNA, herein

designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM41 RNA is designated SEQ ID:215, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[3570] GAM41 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM41 target RNA, herein designated GAM TARGET RNA. GAM41 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3571] GAM41 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM41 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM41 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM41 RNA may have a different number of target binding sites in untranslated regions of a GAM41 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3572] The complementary binding of GAM41 RNA, herein designated GAM RNA, to target binding sites on GAM41 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM41 target RNA into GAM41 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[3573] It is appreciated that GAM41 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM41 target genes. The mRNA of each one of this plu-

rality of GAM41 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM41 RNA, herein designated GAM RNA, and which when bound by GAM41 RNA causes inhibition of translation of respective one or more GAM41 target proteins.

[3574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM41 gene, herein designated GAM GENE, on one or more GAM41 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3575] It is appreciated that specific functions and accordingly

utilities of GAM41 correlate with, and may be deduced from, the identity of the target genes which GAM41 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3576]

[3577]

[3578] AF3P21 (Accession NM_016453.1) is a GAM41 target gene, herein designated TARGET GENE. AF3P21 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AF3P21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AF3P21 BINDING SITE, designated SEQ ID:6543, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3579] A function of GAM41 is therefore inhibition of AF3P21 (Accession NM_016453.1), a gene which has an important role in stress fiber formation induced by active diaphanous protein homolog 1 (drf1). and therefore is associated with Involved in therapy- related leukemia. Accordingly, utilities of GAM41 include diagnosis, prevention and

treatment of Involved in therapy- related leukemia, and of other diseases and clinical conditions associated with AF3P21.

[3580] The function of AF3P21 has been established by previous studies. Sano et al. (2000) identified the AF3p21 gene as a novel fusion partner of the MLL gene (OMIM Ref. No. 159555) in a 23- year- old patient who developed therapy- related leukemia (AML, FAB M5b) with t(3;11)(p21;q23). Hayakawa et al. (2001) further characterized the AF3p21 gene. AF3p21 encodes a nuclear protein consisting of 722 amino acids with an SH3 domain, a proline- rich domain, and a bipartite nuclear localization signal. The protein's SH3 domain has high homology with that of FYN (OMIM Ref. No. 137025). Hayakawa et al. (2001) found that in DNA from the patient's leukemic cells, intron 6 of the MLL gene was fused at a point upstream of exon 1 in the AF3p21 gene, and that the der(11) chromosome formed an MLL- AF3p21 fusion transcript in leukemic cells, whereas the der(3) chromosome did not form any fusion transcript. Dot blot RNA analysis showed that the AF3p21 gene was expressed in all adult and embryonic human tissues examined, including bone marrow, brain, liver, thymus, lung, and skeletal muscle. Northern

blot analysis of HeLa cell RNA detected a 3.5- kb transcript. The protein has an apparent molecular weight of 80 kD and is localized exclusively in the cell nucleus. These results suggested that AF3p21 protein plays a role in signal transduction in the nucleus. Hayakawa et al. (2001) determined that the AF3p21 gene on 3p21 is 19 kb long and consists of 13 exons.

[3581]

[3582] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3583] Hayakawa, A.; Matsuda, Y.; Daibata, M.; Nakamura, H.; Sano, K. : Genomic organization, tissue expression, and cellular localization of AF3p21, a fusion partner of MLL in therapy- related leukemia. Genes Chromosomes Cancer 30: 364- 374, 2001. ; and

[3584] Sano, K.; Hayakawa, A.; Piao, J.- H.; Kosaka, Y.; Nakamura, H. : Novel SH3 protein encoded by the AF3p21 gene is fused to the mixed lineage leukemia protein in a therapy-related leukemi.

[3585] Further studies establishing the function and utilities of AF3P21 are found in John Hopkins OMIM database record ID 606671, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Adaptor-related protein complex 2, alpha 1 subunit (AP2A1, Accession NM_014203.2) is another GAM41 target gene, herein designated TARGET GENE. AP2A1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP2A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP2A1 BINDING SITE, designated SEQ ID:16866, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3586] Another function of GAM41 is therefore inhibition of Adaptor-related protein complex 2, alpha 1 subunit (AP2A1, Accession NM_014203.2), a gene which plays a role in protein sorting in the late- golgi/trans- golgi network (tgn) and/or endosomes. Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2A1.

[3587] The function of AP2A1 has been established by previous studies. Two separate AP2- alpha adaptor subunits of the clathrin coat assembly complex of the mouse were cloned by Robinson (1989). The alpha subunit is part of the so-

called AP2 coat assembly protein complex (see OMIM Ref. No. 601024) which links clathrin (OMIM Ref. No. 118960) to receptors in the coated vesicles. The alpha adaptins are exclusively found in the endocytic coated vesicles. The 2 mouse proteins are 84% identical. Huntingtin- interacting protein 1 (HIP1; 601767) is enriched in membrane- containing cell fractions and has been implicated in vesicle trafficking. It is a multidomain protein containing an epsin (OMIM Ref. No. 607262) N- terminal homology (ENTH) domain, a central coiled- coil- forming region, and a C- terminal actin- binding domain. Waelter et al. (2001) identified 3 HIP1- associated proteins, clathrin heavy chain (CLTC; 118955) and alpha- adaptin A and C. In vitro binding studies revealed that the central coiled- coil domain of HIP1 is required for the interaction with clathrin, whereas DPF- like motifs located upstream to this domain are important for HIP1 binding to the C- terminal 'appendage' domain of alpha- adaptin A and C. Expression of full- length HIP1 in mammalian cells resulted in a punctate cytoplasmic immunostaining characteristic of clathrin- coated vesicles. The authors hypothesized that HIP1 is an endocytic protein, the structural integrity of which may be crucial for maintenance of normal vesicle

size in vivo.

[3588]

[3589] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3590] Robinson, M. S. : Cloning of cDNAs encoding two related 100- kD coated vesicle proteins (alpha- adaptins). J. Cell Biol. 108: 833- 42, 1989. ; and

[3591] Waelter, S.; Scherzinger, E.; Hasenbank, R.; Nordhoff, E.; Lurz, R.; Goehler, H.; Gauss, C.; Sathasivam, K.; Bates, G. P.; Lehrach, H.; Wanker, E. E. : The huntingtin interacting protei.

[3592] Further studies establishing the function and utilities of AP2A1 are found in John Hopkins OMIM database record ID 601026, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calpain 1, (mu/i) large subunit (CAPN1, Accession NM_005186.2) is another GAM41 target gene, herein designated TARGET GENE. CAPN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAPN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of CAPN1 BINDING SITE, designated SEQ ID:3659, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3593] Another function of GAM41 is therefore inhibition of Calpain 1, (mu/i) large subunit (CAPN1, Accession NM_005186.2), a gene which is an intracellular protease that requires calcium for its catalytic activity. Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN1.

[3594] The function of CAPN1 has been established by previous studies. Calpain (calcium- dependent protease; EC 3.4.22.17) is an intracellular protease that requires calcium for its catalytic activity. Two isozymes (CANP1 and CANP2), with different calcium requirements, have been identified. Both are heterodimers composed of L (large, catalytic, 80 kD) and S (small, regulatory, 30 kD) subunits. The isozymes share an identical S subunit (OMIM Ref. No. 114170); differences arise from the L subunits (L1 and L2). Using cDNA clones as probes, Ohno et al. (1989, 1990) mapped the CANPL1 and CANPL2 genes as well as the CANPS gene and a gene for another protein, L3, that is homologous to the other 2 L subunits; they used a combi-

nation of spot blot hybridization with sorted chromosomes and Southern hybridization with human- mouse cell hybrid DNAs. In this way they were able to assign CANPL1 to chromosome 11; CANPL2 to chromosome 1; CANPL3 to chromosome 15; and CANPS to chromosome 19. Courseaux et al. (1996) used a combination of methods to refine maps of the approximately 5- Mb region of 11q13 that includes MEN1 (OMIM Ref. No. 131100). They proposed the following gene order: cen- - PGA- - FTH1- - UGB- - AHNAK- - ROM1- - MDU1- - CHRM1- - COX8- - EMK1- - FKBP2- - PLCB3- - [PYGM, ZFM1]- - FAU- - CAPN1- - [MLK3, RELA]- - FOSL1- - SEA- - CFL1- - tel.

[3595]

[3596] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3597] Ohno, S.; Minoshima, S.; Kudoh, J.; Fukuyama, R.; Shimizu, Y.; Ohmi- Imajoh, S.; Shimizu, N.; Suzuki, K. : Four genes for the calpain family locate on four distinct human chromosomes. Cytogenet. Cell Genet. 53: 225- 229, 1990. ; and

[3598] Courseaux, A.; Grosgeorge, J.; Gaudray, P.; Pannett, A. A. J.; Forbes, S. A.; Williamson, C.; Bassett, D.; Thakker, R. V.;

Teh, B. T.; Farnebo, F.; Shepherd, J.; Skogseid, B.; Larsson, C.

[3599] Further studies establishing the function and utilities of CAPN1 are found in John Hopkins OMIM database record ID 114220, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calsequestrin 1 (fast-twitch, skeletal muscle) (CASQ1, Accession NM_001231.2) is another GAM41 target gene, herein designated TARGET GENE. CASQ1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CASQ1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASQ1 BINDING SITE, designated SEQ ID:4693, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3600] Another function of GAM41 is therefore inhibition of Calsequestrin 1 (fast-twitch, skeletal muscle) (CASQ1, Accession NM_001231.2), a gene which is a mitochondrial calcium- binding protein specific for fast- twitch muscle fibers. Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASQ1.

[3601] The function of CASQ1 has been established by previous studies. Calsequestrin, an acid glycoprotein located in the luminal space of the terminal cisternae of the sarcoplasmic reticulum, binds calcium ion and is believed to function as a storage protein for calcium. Comparison of the complete amino acid sequences of rabbit fast- twitch muscle calsequestrin and dog cardiac muscle calsequestrin, as derived from sequence cDNAs, indicate that these isoforms are clearly the products of different genes. The rabbit fast- twitch muscle calsequestrin has, in the mature protein, 367 amino acid residues. It is synthesized with a 28- residue N- terminal signal sequence that is cleaved off during synthesis. The gene in the rabbit has 11 exons and spans approximately 14 kb of genomic DNA. Fujii et al. (1990) isolated a genomic clone for human fast- twitch skeletal muscle calsequestrin and deduced the amino acid sequence of the protein and the exon- intron boundaries of the gene from its sequence. They assigned the gene to human chromosome 1 through the use of a human- mouse somatic cell hybrid mapping panel. Like the rabbit gene, the human gene has 11 exons, but 5 amino acids near the COOH terminus of the rabbit sequence are lacking in the human protein. By fluo-

rescence in situ hybridization, Otsu et al. (1993) mapped the CASQ1 gene to 1q21. Calmitine is a mitochondrial calcium- binding protein specific for fast- twitch muscle fibers. It is absent in patients with Duchenne and Becker types of muscular dystrophy and in dystrophic dy/dy mice. Bataille et al. (1994) cloned the human cDNA of calmitine. Sequence analysis demonstrated that it was identical to the low affinity but high capacity calcium-binding protein from the sarcoplasmic reticulum, calsequestrin. Calmitine represents the Ca(2+) reservoir of mitochondria; calsequestrin may play a similar role in the sarcoplasmic reticulum.

[3602]

[3603] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3604] Fujii, J.; Willard, H. F.; MacLennan, D. H. : Characterization and localization to human chromosome 1 of human fast-twitch skeletal muscle calsequestrin gene. Somat. Cell Molec. Genet. 16: 185- 189, 1990. ; and

[3605] Bataille, N.; Schmitt, N.; Aumercier- Maes, P.; Ollivier, B.; Lucas- Heron, B.; Lestienne, P. : Molecular cloning of human calmitine, a mitochondrial calcium binding protein,

reveals ident.

[3606] Further studies establishing the function and utilities of CASQ1 are found in John Hopkins OMIM database record ID 114250, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-c motif) receptor 5 (CCR5, Accession NM_000579.1) is another GAM41 target gene, herein designated TARGET GENE. CCR5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCR5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:8238, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3607] Another function of GAM41 is therefore inhibition of Chemokine (c-c motif) receptor 5 (CCR5, Accession NM_000579.1) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5.

[3608] FLJ22814 (Accession NM_024916.1) is another GAM41 target gene, herein designated TARGET GENE. FLJ22814 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ22814, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:2530, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3609] Another function of GAM41 is therefore inhibition of FLJ22814 (Accession NM_024916.1) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22814.

[3610] Interleukin 11 (IL11, Accession NM_000641.2) is another GAM41 target gene, herein designated TARGET GENE. IL11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL11 BINDING SITE, designated SEQ ID:20064, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3611] Another function of GAM41 is therefore inhibition of Interleukin 11 (IL11, Accession NM_000641.2), a gene which

stimulates the proliferation of hematopoietic stem cells and megakaryocyte progenitor cells and induces megakaryocyte maturation. Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL11.

[3612] The function of IL11 has been established by previous studies. Paul et al. (1990) identified and cloned the gene for a new stromal cell- derived lymphopoietic and hematopoietic cytokine which they called interleukin- 11. The cDNA indicated a single reading frame of 597 nucleotides encoding a predicted 199- amino acid polypeptide. The IL11 produced in COS- 1 cells showed an apparent molecular mass of about 23 kD. McKinley et al. (1992) determined that the genomic sequence is 7 kb long and consists of 5 exons and 4 introns. Biologic characterization indicated that in addition to stimulating plasmacytoma proliferation, IL11 stimulates T- cell- dependent development of immunoglobulin- producing B cells and collaborates with IL3 in supporting murine megakaryocyte colony formation (Paul et al., 1990). Du and Williams (1994) reviewed the pleiotropic effects of IL11 on hematopoietic cells. Yang- Feng et al. (1991) demonstrated by in situ hybridization that a cDNA for IL11 maps

to 19q13.3- q13.4. Since translocations involving 19q13 occur in patients with acute lymphocytic leukemia, the IL11 gene may be implicated. Du and Williams (1997) reviewed the molecular, cell biologic, and clinical aspects of interleukin- 11.

[3613]

[3614] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3615] Du, X.; Williams, D. A. : Interleukin- 11: review of molecular, cell biology, and clinical use. Blood 89: 3897- 3908, 1997. ; and

[3616] Du, X. X.; Williams, D. A. : Interleukin- 11: a multifunctional growth factor derived from the hematopoietic microenvironment. Blood 83: 2023- 2030, 1994.

[3617] Further studies establishing the function and utilities of IL11 are found in John Hopkins OMIM database record ID 147681, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC143915 (Accession) is another GAM41 target gene, herein designated TARGET GENE. LOC143915 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC143915, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143915 BINDING SITE, designated SEQ ID:15225, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3618] Another function of GAM41 is therefore inhibition of LOC143915 (Accession) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143915.

[3619] LOC151720 (Accession XM_087279.6) is another GAM41 target gene, herein designated TARGET GENE. LOC151720 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151720, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151720 BINDING SITE, designated SEQ ID:17948, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3620] Another function of GAM41 is therefore inhibition of LOC151720 (Accession XM_087279.6) . Accordingly, utilities of GAM41 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151720.

[3621] LOC196463 (Accession NM_173542.1) is another GAM41 target gene, herein designated TARGET GENE. LOC196463 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196463, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196463 BINDING SITE, designated SEQ ID:1265, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3622] Another function of GAM41 is therefore inhibition of LOC196463 (Accession NM_173542.1) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196463.

[3623] LOC200205 (Accession XM_114152.1) is another GAM41 target gene, herein designated TARGET GENE. LOC200205 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200205, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC200205 BINDING SITE, designated SEQ ID:14178, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3624] Another function of GAM41 is therefore inhibition of LOC200205 (Accession XM_114152.1) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200205.

[3625] Paired-like homeodomain transcription factor 3 (PITX3, Accession NM_005029.3) is another GAM41 target gene, herein designated TARGET GENE. PITX3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PITX3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PITX3 BINDING SITE, designated SEQ ID:8284, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3626] Another function of GAM41 is therefore inhibition of Paired-like homeodomain transcription factor 3 (PITX3, Accession NM_005029.3), a gene which may play a role in

normal anterior- chamber and lens development. and therefore may be associated with Anterior segment mesenchymal dysgenesis (asmd). Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of Anterior segment mesenchymal dysgenesis (asmd)., and of other diseases and clinical conditions associated with PITX3.

[3627] The function of PITX3 has been established by previous studies. The PITX3 gene is the human homolog of the mouse Pitx3 gene and is a member of the RIEG/PITX homeo box gene family. The protein encoded by PITX3 shows 99% amino acid identity to the mouse Pitx3 protein, with 100% identity in the homeodomain and approximately 70% overall identity to other members of this family. Semina et al. (1998) screened a collection of 80 DNA samples from individuals with various eye anomalies for mutations in the PITX3 gene. A mutation was identified in each of 2 unrelated patients. The 17- bp insertion in the 3- prime end of the coding sequence, resulting in a frameshift (602669.0001), occurred in a patient with anterior segment mesenchymal dysgenesis (ASMD; 107250) and cataracts; a G- to- A substitution in the 5- prime end of the gene, changing a codon for serine into a codon for

asparagine (602669.0002), occurred in a patient with congenital cataracts. Each mutation cosegregated with the disease phenotype in families and was not found in up to 300 control individuals studied. Further expression analysis of Pitx3 in the mouse supported a unique role in early ocular development, with later expression extending to the midbrain, tongue, incisors, sternum, vertebrae, and limbs. The findings strongly suggested the role of PITX3 in ASMD and cataracts and provided new evidence of the contribution of the RIEG/PITX gene family to the developmental program underpinning normal eye formation. The PTX1 (OMIM Ref. No. 601542), PTX2 (OMIM Ref. No. 602149), and PTX3 genes define a novel family of transcription factors, the PTX subfamily, within the paired-like class of homeodomain factors. In mice, Ptx1 and Ptx2 gene expression has been detected in the area of the pituitary primordium and is maintained throughout development in the Rathke pouch and adult pituitary. Pellegrini- Bouiller et al. (1999) characterized the expression of the PTX1, PTX2, and PTX3 genes in the normal human pituitary and in the different types of human pituitary adenomas. RT- PCR analysis detected no PTX3 expression in adult and fetal normal human pituitary, although a spe-

cific band was readily amplified from fetal mesencephalon, a tissue known to express this gene.

[3628] Animal model experiments lend further support to the function of PITX3. Mouse 'aphakia' (ak) is a recessive phenotype that spontaneously occurs in the 129/Sv- SlJ strain and is characterized by small eyes that lack a lens. Semina et al. (1997) determined that the Pitx3 gene is expressed in the developing lens and maps to chromosome 19, close to ak in mouse. In further studies, Semina et al. (2000) did not detect by in situ hybridization Pitx3 transcripts in ak/ak mice, either in the lens placode or at later developmental stages of the lens. Although no differences were previously found between ak/ak and wildtype sequences in the Pitx3 coding region, the authors identified a deletion of 652 bp located 2.5 kb upstream from the start point of the Pitx3 5- prime untranslated region sequence in ak/ak mice. The deletion cosegregated with the ak mutation and was not detected in 16 samples from 10 different mouse strains, including the founder strains. Analysis of the 652- bp region identified sequences similar to consensus binding sites for transcription factors AP2 (see OMIM Ref. No. 107580) and Maf (see OMIM Ref. No. 177075) that were shown to play a critical role in lens de-

termination. The authors concluded that the abnormal ocular development in the aphakia mouse is due to the deletion upstream of the Pitx3 gene.

[3629] It is appreciated that the abovementioned animal model for PITX3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3630] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3631] Semina, E. V.; Ferrell, R. E.; Mintz- Hittner, H. A.; Bitoun, P.; Alward, W. L. M.; Reiter, R. S.; Funkhauser, C.; Daack-Hirsch, S.; Murray, J. C. : A novel homeobox gene PITX3 is mutated in families with autosomal- dominant cataracts and ASMD. Nature Genet. 19: 167- 170, 1998. ; and

[3632] Semina, E. V.; Murray, J. C.; Reiter, R.; Hrstka, R. F.; Graw, J. : Deletion in the promoter region and altered expression of Pitx3 homeobox gene in aphakia mice. Hum. Molec. Genet. 9:.

[3633] Further studies establishing the function and utilities of PITX3 are found in John Hopkins OMIM database record ID 602669, and in cited publications listed in Table 5, which are hereby incorporated by reference.POLA2 (Accession

NM_002689.2) is another GAM41 target gene, herein designated TARGET GENE. POLA2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by POLA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLA2 BINDING SITE, designated SEQ ID:16991, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3634] Another function of GAM41 is therefore inhibition of POLA2 (Accession NM_002689.2) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLA2.

[3635] SSH2 (Accession XM_290798.1) is another GAM41 target gene, herein designated TARGET GENE. SSH2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SSH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:8354, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3636] Another function of GAM41 is therefore inhibition of SSH2 (Accession XM_290798.1) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2.

[3637] TRIAD3 (Accession NM_019011.3) is another GAM41 target gene, herein designated TARGET GENE. TRIAD3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIAD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIAD3 BINDING SITE, designated SEQ ID:11583, to the nucleotide sequence of GAM41 RNA, herein designated GAM RNA, also designated SEQ ID:215.

[3638] Another function of GAM41 is therefore inhibition of TRIAD3 (Accession NM_019011.3) . Accordingly, utilities of GAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIAD3.

[3639]

[3640] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 42 (GAM42), which modulates expression of respective target

genes thereof, the function and utility of which target genes is known in the art.

[3641] GAM42 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM42 was detected is described hereinabove with reference to Figs. 8-15.

[3642] GAM42 gene, herein designated GAM GENE, and GAM42 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[3643] GAM42 gene encodes a GAM42 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM42 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM42 precursor RNA is designated SEQ ID:190, and is provided hereinbelow with reference to the sequence listing part.

[3644] GAM42 precursor RNA folds onto itself, forming GAM42 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3645] GAM42 precursor RNA folds onto itself, forming GAM42 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[3646] Nucleotide sequence of GAM42 precursor RNA, designated SEQ-ID: 190, and a schematic representation of a predicted secondary folding of GAM42 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[3647] An enzyme complex designated DICER COMPLEX, `dices` the GAM42 folded precursor RNA into GAM42 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising

an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM42 RNA is designated SEQ ID:224, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[3648] GAM42 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM42 target RNA, herein designated GAM TARGET RNA. GAM42 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3649] GAM42 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM42 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM42 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM42 RNA may have a different number of target binding sites in untranslated regions of a GAM42 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3650] The complementary binding of GAM42 RNA, herein designated GAM RNA, to target binding sites on GAM42 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM42 target RNA into GAM42 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[3651] It is appreciated that GAM42 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM42 target genes. The mRNA of each one of this plurality of GAM42 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM42 RNA, herein designated GAM RNA, and which when bound by

GAM42 RNA causes inhibition of translation of respective one or more GAM42 target proteins.

[3652] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM42 gene, herein designated GAM GENE, on one or more GAM42 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3653] It is appreciated that specific functions and accordingly utilities of GAM42 correlate with, and may be deduced from, the identity of the target genes which GAM42 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3654]

[3655]

[3656] Cerebellar degeneration-related protein 2, 62kda (CDR2, Accession XM_071866.2) is a GAM42 target gene, herein designated TARGET GENE. CDR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDR2 BINDING SITE, designated SEQ ID:4901, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3657] A function of GAM42 is therefore inhibition of Cerebellar degeneration-related protein 2, 62kda (CDR2, Accession XM_071866.2), a gene which plays a role in cytokinesis, cell shape, and functions such as secretion and capping. and therefore may be associated with Paraneoplastic cerebellar degeneration. Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of Paraneoplastic cerebellar degeneration, and of other diseases and clinical conditions associated with CDR2.

[3658] The function of CDR2 has been established by previous

studies. Paraneoplastic cerebellar degeneration is an autoimmune disorder associated with neoplasms of lung, ovary, breast, or Hodgkin disease. Patients with paraneoplastic cerebellar degeneration carry a characteristic antibody called anti- Yo. On Western blot analysis of Purkinje cells and tumor tissue, the anti- Yo sera react with at least 2 antigens, a major species of 62 kD called CDR62 and a minor species of 34 kD called CDR34, where CDR means cerebellar degeneration- related. CDR34 is encoded by a gene on the X chromosome (CDR1; 302650). Furneaux et al. (1990) cloned and characterized the gene encoding CDR62, a leucine- zipper DNA- binding protein; see Fathallah- Shaykh et al. (1991). By a combination of study of rodent/human somatic cell hybrids and in situ hybridization, Gress et al. (1991, 1992) assigned the CDR2 gene to 16p13.1- p12. The gene is positioned in an interval that contains 2 rare heritable fragile sites. Fletcher et al. (1997) determined the mouse chromosomal locations of 9 genes that encode 'onconeuronal antigens,' i.e., antigens that are expressed by systemic tumors and elicit an immune response that may develop into an autoimmune neuronal degeneration. One of these genes was the Cdr2 gene, which they mapped to mouse chromosome 7 in a

region of homology to 16p13.1- p12.

[3659]

[3660] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3661] Fathallah- Shaykh, H.; Wolf, S.; Wong, E.; Posner, J. B. : Cloning of a leucine- zipper protein recognized by the sera of patients with antibody- associated paraneoplastic cerebellar degeneration. Proc. Nat. Acad. Sci. 88: 3451-3454, 1991. ; and

[3662] Furneaux, H. M.; Rosenblum, M. K.; Dalmau, J.; Wong, E.; Woodruff, P.; Graus, F.; Posner, J. B. : Selective expression of Purkinje- cell antigens in tumor tissue from patients with parane.

[3663] Further studies establishing the function and utilities of CDR2 are found in John Hopkins OMIM database record ID 117340, and in cited publications listed in Table 5, which are hereby incorporated by reference.CDT1 (Accession NM_030928.2) is another GAM42 target gene, herein designated TARGET GENE. CDT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDT1 BINDING SITE, designated SEQ ID:1061, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3664] Another function of GAM42 is therefore inhibition of CDT1 (Accession NM_030928.2) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT1.

[3665] Fragile x mental retardation 2 (FMR2, Accession NM_002025.1) is another GAM42 target gene, herein designated TARGET GENE. FMR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FMR2 BINDING SITE, designated SEQ ID:17857, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3666] Another function of GAM42 is therefore inhibition of Fragile x mental retardation 2 (FMR2, Accession NM_002025.1) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR2.

[3667] Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NM_000148.1) is another GAM42 target gene, herein designated TARGET GENE. FUT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT1 BINDING SITE, designated SEQ ID:10946, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3668] Another function of GAM42 is therefore inhibition of Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NM_000148.1) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT1.

[3669] Growth arrest and dna-damage-inducible, alpha (GADD45A, Accession NM_001924.2) is another GAM42 target gene, herein designated TARGET GENE. GADD45A BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by GADD45A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GADD45A BINDING SITE, designated SEQ ID:510, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3670] Another function of GAM42 is therefore inhibition of Growth arrest and dna-damage-inducible, alpha (GADD45A, Accession NM_001924.2) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GADD45A.

[3671] HCGIV.9 (Accession NM_018985.1) is another GAM42 target gene, herein designated TARGET GENE. HCGIV.9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HCGIV.9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HCGIV.9 BINDING SITE, designated SEQ ID:5331, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3672] Another function of GAM42 is therefore inhibition of HCGIV.9 (Accession NM_018985.1) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCGIV.9.

[3673] LOC123872 (Accession XM_058742.3) is another GAM42 target gene, herein designated TARGET GENE. LOC123872 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC123872, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123872 BINDING SITE, designated SEQ ID:13097, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3674] Another function of GAM42 is therefore inhibition of LOC123872 (Accession XM_058742.3) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123872.

[3675] LOC158427 (Accession NM_139246.2) is another GAM42 target gene, herein designated TARGET GENE. LOC158427 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC158427, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158427 BINDING SITE, designated SEQ ID:11756, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3676] Another function of GAM42 is therefore inhibition of LOC158427 (Accession NM_139246.2) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158427.

[3677] LOC197201 (Accession XM_113839.4) is another GAM42 target gene, herein designated TARGET GENE. LOC197201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:3966, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3678] Another function of GAM42 is therefore inhibition of

LOC197201 (Accession XM_113839.4) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201.

[3679] LOC203202 (Accession XM_038391.6) is another GAM42 target gene, herein designated TARGET GENE. LOC203202 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC203202, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203202 BINDING SITE, designated SEQ ID:4902, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3680] Another function of GAM42 is therefore inhibition of LOC203202 (Accession XM_038391.6) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203202.

[3681] LOC256830 (Accession) is another GAM42 target gene, herein designated TARGET GENE. LOC256830 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256830, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256830 BINDING SITE, designated SEQ ID:18604, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3682] Another function of GAM42 is therefore inhibition of LOC256830 (Accession) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256830.

[3683] Protein o-fucosyltransferase 1 (POFUT1, Accession NM_015352.1) is another GAM42 target gene, herein designated TARGET GENE. POFUT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by POFUT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POFUT1 BINDING SITE, designated SEQ ID:7440, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3684] Another function of GAM42 is therefore inhibition of Protein o-fucosyltransferase 1 (POFUT1, Accession

NM_015352.1) . Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POFUT1.

[3685] Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NM_139071.1) is another GAM42 target gene, herein designated TARGET GENE. SMARCD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE, designated SEQ ID:9206, to the nucleotide sequence of GAM42 RNA, herein designated GAM RNA, also designated SEQ ID:224.

[3686] Another function of GAM42 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NM_139071.1), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1.

[3687] The function of SMARCD1 has been established by previ-

ous studies. Chromatin is actively remodeled during development. Chromatin remodeling of certain genes appears to precede their transcriptional activation. In yeast, the multisubunit SWI/SNF complex is thought to be responsible for chromatin remodeling. Wang et al. (1996) isolated an analogous SWI/SNF complex from the human YT cell line. They found that the resultant complexes are composed of 9 to 12 polypeptides, which they termed BAFs (for BRG1- associated factors). Wang et al. (1996) isolated the BAF60a subunit, which encodes a polypeptide of 435 amino acids and is homologous to the yeast SWP73 gene. The authors used BAF60a as a probe to isolate 2 closely related homologs, BAF60b (OMIM Ref. No. 601736) and BAF60c (OMIM Ref. No. 601737). By PCR of a somatic cell hybrid panel and radiation hybrid analysis, Ring et al. (1998) mapped the SMARCD1 gene to chromosome 12q13- q14.

[3688]

[3689] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3690] Ring, H. Z.; Vameghi- Meyers, V.; Wang, W.; Crabtree, G. R.; Francke, U. : Five SWI/SNF- related, matrix- associ-

ated, actin- dependent regulator of chromatin (SMARC) genes are dispersed in the human genome. Genomics 51: 140- 143, 1998. ; and

[3691] Wang, W.; Xue, Y.; Zhou, S.; Kuo, A.; Cairns, B. R.; Crabtree, G. R. : Diversity and specialization of mammalian SWI/SNF complexes. Genes Dev. 10: 2117- 2130, 1996.

[3692] Further studies establishing the function and utilities of SMARCD1 are found in John Hopkins OMIM database record ID 601735, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[3693] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 43 (GAM43), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[3694] GAM43 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM43 was detected is described hereinabove with reference to Figs. 8-15.

[3695] GAM43 gene, herein designated GAM GENE, and GAM43 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[3696] GAM43 gene encodes a GAM43 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM43 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM43 precursor RNA is designated SEQ ID:95, and is provided hereinbelow with reference to the sequence listing part.

[3697] GAM43 precursor RNA folds onto itself, forming GAM43 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3698] GAM43 precursor RNA folds onto itself, forming GAM43 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[3699] Nucleotide sequence of GAM43 precursor RNA, designated SEQ-ID: 95, and a schematic representation of a predicted secondary folding of GAM43 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[3700] An enzyme complex designated DICER COMPLEX, `dices` the GAM43 folded precursor RNA into GAM43 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM43 RNA is designated SEQ ID:234, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[3701] GAM43 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM43 target RNA, herein designated GAM TARGET RNA. GAM43 target

RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3702] GAM43 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM43 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM43 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM43 RNA may have a different number of target binding sites in untranslated regions of a GAM43 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3703] The complementary binding of GAM43 RNA, herein designated GAM RNA, to target binding sites on GAM43 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM43 target RNA into GAM43 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[3704] It is appreciated that GAM43 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM43 target genes. The mRNA of each one of this plurality of GAM43 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM43 RNA, herein designated GAM RNA, and which when bound by GAM43 RNA causes inhibition of translation of respective one or more GAM43 target proteins.

[3705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM43 gene, herein designated GAM GENE, on one or more GAM43 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the back-

ground section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3706] It is appreciated that specific functions and accordingly utilities of GAM43 correlate with, and may be deduced from, the identity of the target genes which GAM43 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3707]

[3708]

[3709] MYLE (Accession NM_014015.2) is a GAM43 target gene, herein designated TARGET GENE. MYLE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYLE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of MYLE BINDING SITE, designated SEQ ID:19493, to the nucleotide sequence of GAM43 RNA, herein designated GAM RNA, also designated SEQ ID:234.

[3710] A function of GAM43 is therefore inhibition of MYLE (Accession NM_014015.2) . Accordingly, utilities of GAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLE.

[3711] NRF (Accession NM_017544.1) is another GAM43 target gene, herein designated TARGET GENE. NRF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NRF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NRF BINDING SITE, designated SEQ ID:18272, to the nucleotide sequence of GAM43 RNA, herein designated GAM RNA, also designated SEQ ID:234.

[3712] Another function of GAM43 is therefore inhibition of NRF (Accession NM_017544.1) . Accordingly, utilities of GAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF.

[3713]

[3714] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 44 (GAM44), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[3715] GAM44 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM44 was detected is described hereinabove with reference to Figs. 8-15.

[3716] GAM44 gene, herein designated GAM GENE, and GAM44 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[3717] GAM44 gene encodes a GAM44 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM44 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM44 precursor RNA is designated SEQ ID:188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:188 is located at position 48222381 relative to chromosome 11.

[3718] GAM44 precursor RNA folds onto itself, forming GAM44

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3719] GAM44 precursor RNA folds onto itself, forming GAM44 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[3720] Nucleotide sequence of GAM44 precursor RNA, designated SEQ-ID: 188, and a schematic representation of a predicted secondary folding of GAM44 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[3721] An enzyme complex designated DICER COMPLEX, `dices`

the GAM44 folded precursor RNA into GAM44 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM44 RNA is designated SEQ ID:287, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[3722] GAM44 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM44 target RNA, herein designated GAM TARGET RNA. GAM44 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3723] GAM44 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM44 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM44

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM44 RNA may have a different number of target binding sites in untranslated regions of a GAM44 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3724] The complementary binding of GAM44 RNA, herein designated GAM RNA, to target binding sites on GAM44 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM44 target RNA into GAM44 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[3725] It is appreciated that GAM44 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM44 target genes. The mRNA of each one of this plurality of GAM44 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM44 RNA, herein designated GAM RNA, and which when bound by GAM44 RNA causes inhibition of translation of respective one or more GAM44 target proteins.

[3726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM44 gene, herein designated GAM GENE, on one or more GAM44 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3727] It is appreciated that specific functions and accordingly utilities of GAM44 correlate with, and may be deduced from, the identity of the target genes which GAM44 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3728]

[3729]

[3730] Angiotensin i converting enzyme (peptidyl-dipeptidase a) 1 (ACE, Accession NP_690044.1) is a GAM44 target gene, herein designated TARGET GENE. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACE BINDING SITE, designated SEQ ID:2830, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3731] A function of GAM44 is therefore inhibition of Angiotensin i converting enzyme (peptidyl-dipeptidase a) 1 (ACE, Accession NP_690044.1), a gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). Accord-

ingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACE.

[3732] The function of ACE has been established by previous studies. Angiotensin I- converting enzyme (EC 3.4.15.1), or kininase II, is a dipeptidyl carboxypeptidase that plays an important role in blood pressure regulation and electrolyte balance by hydrolyzing angiotensin I into angiotensin II, a potent vasopressor, and aldosterone- stimulating peptide. The enzyme is also able to inactivate bradykinin, a potent vasodilator. Howard et al. (1990) found that the testis- specific form of ACE has its own promoter within intron 12, is encoded by the 3- prime region of the gene, and is found only in postmeiotic spermatogenic cells and sperm. Exner et al. (2001) focused on the fact that black patients with heart failure have a poorer prognosis than white patients and performed a study comparing racial groups.

[3733]

[3734] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3735] Howard, T. E.; Shai, S. Y.; Langford, K. G.; Martin, B. M.;

Bernstein, K. E. : Transcription of testicular angiotensin-converting enzyme (ACE) is initiated within the 12th intron of the somatic ACE gene. Molec. Cell. Biol. 10: 4294-4302, 1990. ; and

[3736] Exner, D. V.; Dries, D. L.; Domanski, M. J.; Cohn, J. N. : Lesser response to angiotensin- converting- enzyme inhibitor therapy in black as compared with white patients with left ventricu.

[3737] Further studies establishing the function and utilities of ACE are found in John Hopkins OMIM database record ID 106180, and in cited publications listed in Table 5, which are hereby incorporated by reference.ANP32E (Accession NP_112182.1) is another GAM44 target gene, herein designated TARGET GENE. ANP32E BINDING SITE1 and ANP32E BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ANP32E, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANP32E BINDING SITE1 and ANP32E BINDING SITE2, designated SEQ ID:16172 and SEQ ID:11390 respectively, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3738] Another function of GAM44 is therefore inhibition of ANP32E (Accession NP_112182.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANP32E.

[3739] Adaptor-related protein complex 3, mu 2 subunit (AP3M2, Accession NP_006794.1) is another GAM44 target gene, herein designated TARGET GENE. AP3M2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AP3M2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP3M2 BINDING SITE, designated SEQ ID:17766, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3740] Another function of GAM44 is therefore inhibition of Adaptor-related protein complex 3, mu 2 subunit (AP3M2, Accession NP_006794.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M2.

[3741] Rho guanine nucleotide exchange factor (gef) 12 (ARHGEF12, Accession NP_056128.1) is another GAM44 target gene, herein designated TARGET GENE. ARHGEF12

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGEF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF12 BINDING SITE, designated SEQ ID:6308, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3742] Another function of GAM44 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 12 (ARHGEF12, Accession NP_056128.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF12.

[3743] Aspartate beta-hydroxylase (ASPH, Accession NP_064549.1) is another GAM44 target gene, herein designated TARGET GENE. ASPH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ASPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE, designated SEQ ID:11418, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA,

also designated SEQ ID:287.

[3744] Another function of GAM44 is therefore inhibition of Aspartate beta-hydroxylase (ASPH, Accession NP_064549.1), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)- like domains of a number of proteins. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH.

[3745] The function of ASPH has been established by previous studies. In hepatocellular carcinoma (HCC; 114550), one of the most prevalent tumors in the world which occurs with especially high frequency in sub- Saharan Africa and the Far East, a specific antigen is highly expressed; it is highly expressed also in cholangiocarcinomas. Lavaissiere et al. (1996) reported cDNA cloning of the human gene encoding this antigen, aspartyl(asparaginyl)- beta- hydroxylase (symbolized HAAH by them), and demonstrated that in these tumor lines it is expressed in an enzymatically active form. The gene encodes a deduced 744-amino acid polypeptide with high homology (81%) to the bovine gene (Jia et al., 1992). Lavaissiere et al. (1996) found that their cDNA human sequence was 99% homolo-

gous to the sequence for ASPH reported by Korioth et al. (1994), differing only at amino acid residues 565 (tyr to ile), 575 (trp- trp- thr to cys- gly), 585 (asp to gln), and 709 (arg to lys). They noted also a silent TCG- to- TCA transition at peptide residue 161. Lavaissiere et al. (1996) speculated about the possible relationship of the malig- nant phenotype of regulated aspartyl/asparaginyl- beta- hydroxylation in EGF- like domains of proteins such as the mammalian Notch homologs (e.g., 190198, 600275, and 600276), which are known to be involved in cell differen- tiation and whose cytoplasmic domains have been shown to be oncogenic. By screening a heart cDNA library, fol- lowed by RT- PCR, Lim et al. (2000) isolated cDNAs en- coding the 225- amino acid junctin protein and a 210- amino acid isoform. The authors noted that a 73- residue stretch in junctin has a completely matched region in the ASPH protein. Southern blot analysis indicated that junctin and ASPH exist as a single- copy gene. Northern blot analysis revealed expression of 3.0- and 4.2- kb tran- scripts in cardiac and skeletal muscle; expression was higher in skeletal muscle. SDS- PAGE analysis of the translated cDNAs showed expression of 26- and 28- kD proteins. By screening a skeletal muscle cDNA library with

a dog junctin probe, Treves et al. (2000) identified cDNAs encoding human junctin and junctate. Sequence analysis predicted that junctate, a 299- amino acid protein, shares the first 93 amino acids of the long isoform of junctin (and, partially, of ASPH), whereas its 64 C- terminal residues are identical to the central region of ASPH. Northern blot analysis detected a 2.6- kb transcript in heart, brain, pancreas, placenta, lung, liver, kidney, and skeletal muscle; highest levels were in heart, brain, and pancreas, and lowest levels were in skeletal muscle. In contrast, junctin was expressed only in cardiac and skeletal muscle. Southern blot and PCR analyses indicated that ASPH, junctin, and junctate are splice variants of the same gene; ASPH uses exons 1, 3, 5, and 8 through 16, whereas junctin uses exons 2, 3, 5, and 6, and junctate uses exons 2 through 5 and 8 through 16. Fluorescence microscopy showed junctate expression in sarco(endo)plasmic reticulum membranes. Immunoblot analysis indicated that junctate is expressed as a 32- kD protein in kidney microsomes. Binding analysis determined that junctate binds calcium with high capacity and moderate affinity.

[3746]

[3747] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[3748] Lavaissiere, L.; Jia, S.; Nishiyama, M.; de la Monte, S.; Stern, A. M.; Wands, J. R.; Friedman, P. A. : Overexpression of human aspartyl(asparaginyl)- beta- hydroxylase in hepatocellular carcinoma and cholangiocarcinoma. J. Clin. Invest. 98: 1313- 1323, 1996. ; and

[3749] Treves, S.; Feriotto, G.; Moccagatta, L.; Gambari, R.; Zorzato, F. : Molecular cloning, expression, functional characterization, chromosomal localization, and gene structure of junctate.

[3750] Further studies establishing the function and utilities of ASPH are found in John Hopkins OMIM database record ID 600582, and in cited publications listed in Table 5, which are hereby incorporated by reference.Aspartate beta-hydroxylase (ASPH, Accession NP_115856.1) is another GAM44 target gene, herein designated TARGET GENE. ASPH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ASPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE, designated

SEQ ID:11418, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3751] Another function of GAM44 is therefore inhibition of Aspartate beta-hydroxylase (ASPH, Accession NP_115856.1), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)- like domains of a number of proteins. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH.

[3752] The function of ASPH has been established by previous studies. In hepatocellular carcinoma (HCC; 114550), one of the most prevalent tumors in the world which occurs with especially high frequency in sub- Saharan Africa and the Far East, a specific antigen is highly expressed; it is highly expressed also in cholangiocarcinomas. Lavaissiere et al. (1996) reported cDNA cloning of the human gene encoding this antigen, aspartyl(asparaginyl)- beta- hydroxylase (symbolized HAAH by them), and demonstrated that in these tumor lines it is expressed in an enzymatically active form. The gene encodes a deduced 744-amino acid polypeptide with high homology (81%) to the bovine gene (Jia et al., 1992). Lavaissiere et al. (1996)

found that their cDNA human sequence was 99% homologous to the sequence for ASPH reported by Korioth et al. (1994), differing only at amino acid residues 565 (tyr to ile), 575 (trp- trp- thr to cys- gly), 585 (asp to gln), and 709 (arg to lys). They noted also a silent TCG- to- TCA transition at peptide residue 161. Lavaissiere et al. (1996) speculated about the possible relationship of the malignant phenotype of regulated aspartyl/asparaginyl- beta-hydroxylation in EGF- like domains of proteins such as the mammalian Notch homologs (e.g., 190198, 600275, and 600276), which are known to be involved in cell differentiation and whose cytoplasmic domains have been shown to be oncogenic. By screening a heart cDNA library, followed by RT- PCR, Lim et al. (2000) isolated cDNAs encoding the 225- amino acid junctin protein and a 210-amino acid isoform. The authors noted that a 73- residue stretch in junctin has a completely matched region in the ASPH protein. Southern blot analysis indicated that junctin and ASPH exist as a single- copy gene. Northern blot analysis revealed expression of 3.0- and 4.2- kb transcripts in cardiac and skeletal muscle; expression was higher in skeletal muscle. SDS- PAGE analysis of the translated cDNAs showed expression of 26- and 28- kD

proteins. By screening a skeletal muscle cDNA library with a dog junctin probe, Treves et al. (2000) identified cDNAs encoding human junctin and junctate. Sequence analysis predicted that junctate, a 299- amino acid protein, shares the first 93 amino acids of the long isoform of junctin (and, partially, of ASPH), whereas its 64 C- terminal residues are identical to the central region of ASPH. [3757] Further studies establishing the function and utilities of ASPH are found in John Hopkins OMIM database record ID 600582, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atpase, na+/k+ transporting, beta 3 polypeptide (ATP1B3, Accession NP_001670.1) is another GAM44 target gene, herein designated TARGET GENE. ATP1B3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1B3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of ATP1B3 BINDING SITE, designated SEQ ID:9521, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3758] Another function of GAM44 is therefore inhibition of Atpase, na+/k+ transporting, beta 3 polypeptide (ATP1B3, Accession NP_001670.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B3.

[3759] Atpase, ca++ transporting, type 2c, member 1 (ATP2C1, Accession NP_055197.1) is another GAM44 target gene, herein designated TARGET GENE. ATP2C1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP2C1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP2C1 BINDING SITE, designated SEQ ID:9108, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3760] Another function of GAM44 is therefore inhibition of Atpase, ca++ transporting, type 2c, member 1 (ATP2C1, Accession NP_055197.1) . Accordingly, utilities of GAM44

include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2C1.

[3761] Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1) is another GAM44 target gene, herein designated TARGET GENE. BACH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BACH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:13836, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3762] Another function of GAM44 is therefore inhibition of Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1), a gene which acts as repressor or activator, binds to maf recognition elements and therefore may be associated with Non-hodgkin lymphoma. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Non-hodgkin lymphoma, and of other diseases and clinical conditions associated with BACH2.

[3763] The function of BACH2 has been established by previous

studies. By screening a K562 erythroleukemia cell line with mouse Bach2 cDNA as the probe, Sasaki et al. (2000) isolated a cDNA encoding BACH2. The deduced 841- amino acid protein is 89.5% identical to mouse Bach2, with 97% identity shared in the BTB and bZip functional domains and 94% identity shared in the serine- rich region. Northern blot analysis revealed expression of an approximately 11.0- kb BACH2 transcript restricted to thymus, spleen, and leukocytes; low levels were also detected in small intestine and brain. Sasaki et al. (2000) found mRNA and protein expression primarily in B- lymphoid rather than other hematopoietic cell lines. RT- PCR analysis showed that BACH2, like mouse Bach2, is expressed in primary B cells at the progenitor, precursor, immature, and mature B- cell stages. Mouse Bach2 is not expressed in plasma cells (Muto et al., 1998). Gel shift analysis showed that when overexpressed, BACH2 binds to MAF recognition elements (MARE). Overexpression also resulted in a loss of clonogenic activity. Southern blot analysis determined that BACH2 is a single- copy gene. BACH2/CA- 1 microsatellite analysis indicated that loss of heterozygosity occurred in 5 of 25 non- Hodgkin lymphoma (OMIM Ref. No. 605027) patients.

[3764]

[3765] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3766] Sasaki, S.; Ito, E.; Toki, T.; Maekawa, T.; Kanezaki, R.; Umenai, T.; Muto, A.; Nagai, H.; Kinoshita, T.; Yamamoto, M.; Inazawa, J.; Taketo, M. M.; Nakahata, T.; Igarashi, K.; Yokoyama, M. : Cloning and expression of human B cell-specific transcription factor BACH2 mapped to chromosome 6q15. Oncogene 19: 3739- 3749, 2000. ; and

[3767] Muto, A.; Hoshino, H.; Madisen, L.; Yanai, N.; Obinata, M.; Karasuyama, H.; Hayashi, N.; Nakauchi, H.; Yamamoto, M.; Groudine, M.; Igarashi, K. : Identification of Bach2 as a B-cell- spe.

[3768] Further studies establishing the function and utilities of BACH2 are found in John Hopkins OMIM database record ID 605394, and in cited publications listed in Table 5, which are hereby incorporated by reference.BHC80 (Accession NP_057705.2) is another GAM44 target gene, herein designated TARGET GENE. BHC80 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BHC80, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BHC80 BINDING SITE, designated SEQ ID:7380, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3769] Another function of GAM44 is therefore inhibition of BHC80 (Accession NP_057705.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHC80.

[3770] C14orf24 (Accession NP_775878.1) is another GAM44 target gene, herein designated TARGET GENE. C14orf24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf24 BINDING SITE, designated SEQ ID:831, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3771] Another function of GAM44 is therefore inhibition of C14orf24 (Accession NP_775878.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf24.

[3772] C14orf39 (Accession NP_777638.1) is another GAM44 target gene, herein designated TARGET GENE. C14orf39 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf39 BINDING SITE, designated SEQ ID:10766, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3773] Another function of GAM44 is therefore inhibition of C14orf39 (Accession NP_777638.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf39.

[3774] C14orf78 (Accession XP_290629.1) is another GAM44 target gene, herein designated TARGET GENE. C14orf78 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf78, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf78 BINDING SITE, designated SEQ ID:11042, to the nucleotide sequence of GAM44 RNA, herein designated

GAM RNA, also designated SEQ ID:287.

[3775] Another function of GAM44 is therefore inhibition of C14orf78 (Accession XP_290629.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf78.

[3776] Chromosome 21 open reading frame 55 (C21orf55, Accession NP_060303.1) is another GAM44 target gene, herein designated TARGET GENE. C21orf55 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C21orf55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf55 BINDING SITE, designated SEQ ID:15819, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3777] Another function of GAM44 is therefore inhibition of Chromosome 21 open reading frame 55 (C21orf55, Accession NP_060303.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf55.

[3778] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) is another GAM44 target gene, herein des-

ignated TARGET GENE. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by C5orf4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:2131 and SEQ ID:16902 respectively, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3779] Another function of GAM44 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[3780] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) is another GAM44 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by C5orf4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:16902 and SEQ ID:18232 respectively, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3781] Another function of GAM44 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[3782] Cholecystokinin b receptor (CCKBR, Accession NP_795344.1) is another GAM44 target gene, herein designated TARGET GENE. CCKBR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCKBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCKBR BINDING SITE, designated SEQ ID:6458, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3783] Another function of GAM44 is therefore inhibition of Cholecystokinin b receptor (CCKBR, Accession

NP_795344.1), a gene which bonds cholecystokinin, regulates emotion and gastric acid secretion. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCKBR.

[3784] The function of CCKBR has been established by previous studies. The cholecystokinin (CCK) family of peptides (see OMIM Ref. No. 118440) and their receptors are widely distributed throughout the central nervous system and gastrointestinal tract. The receptors can be divided into 2 subtypes on the basis of their affinity for nonsulfated analogs of CCK. Type A receptors, which have a high affinity only for sulfated CCK- 8, are found principally in the gastrointestinal tract and select areas of the CNS, while type B (gastrin) receptors, having a high affinity for both sulfated and nonsulfated CCK analogs, are found principally in the CNS and select areas of the gastrointestinal tract. Highly selective, nonpeptide antagonists have been developed that support this subtype classification. In the CNS, type B receptors regulate anxiety, arousal, neuroleptic activity, and opiate- induced analgesia. Outside the CNS, they regulate gastric acid secretion and may play a role in gastrointestinal motility and growth

of normal and neoplastic gastrointestinal tissue. The CCKB/gastrin receptor (CCKBR) can selectively be blocked by nonpeptide benzodiazepine- based antagonists. Beinborn et al. (1993) found that a single amino acid, valine-319, is critical in determining the binding affinity for these nonpeptide antagonists. They showed that it is the variability in the aliphatic side chain of the amino acid in position 319 that confers antagonist specificity and concluded that the residues underlying nonpeptide antagonist affinity must differ from those that confer against specificity. Pisegna et al. (1992) used a rat type B receptor cDNA to isolate cDNA for the human counterpart. They found that it encodes a 447- amino acid protein with 90% identity to both rat type B CCK receptor and canine gastrin receptor. Northern hybridization identified transcripts in stomach, pancreas, brain, and gall bladder. Using a somatic cell hybrid panel of human/hamster DNAs and Southern blot analysis, they demonstrated that the CCKBR gene is located on chromosome 11. Expression of the receptor of the cDNA in COS- 7 cells was characteristic of a type B CCK receptor pharmacology. Zimonjic et al. (1994) assigned the CCKBR gene to 11p15.5- p15.4 by in situ hybridization.

[3785]

[3786] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3787] Beinborn, M.; Lee, Y.- M.; McBride, E. W.; Quinn, S. M.; Kopin, A. S. : A single amino acid of the cholecystokinin-B/gastrin receptor determines specificity for non- peptide antagonists. Nature 362: 348- 350, 1993. ; and

[3789] Further studies establishing the function and utilities of CCKBR are found in John Hopkins OMIM database record ID 118445, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cholecystokinin b receptor (CCKBR, Accession NP_000722.2) is another GAM44 target gene, herein designated TARGET GENE. CCKBR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCKBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of CCKBR BINDING SITE, designated SEQ ID:6458, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3790] Another function of GAM44 is therefore inhibition of Cholecystokinin b receptor (CCKBR, Accession NP_000722.2), a gene which bonds cholecystokinin, regulates emotion and gastric acid secretion. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCKBR.

[3791] The function of CCKBR has been established by previous studies. The cholecystokinin (CCK) family of peptides (see OMIM Ref. No. 118440) and their receptors are widely distributed throughout the central nervous system and gastrointestinal tract. The receptors can be divided into 2 subtypes on the basis of their affinity for nonsulfated analogs of CCK. Type A receptors, which have a high affinity only for sulfated CCK- 8, are found principally in the gastrointestinal tract and select areas of the CNS, while type B (gastrin) receptors, having a high affinity for both sulfated and nonsulfated CCK analogs, are found principally in the CNS and select areas of the gastroin-

testinal tract. Highly selective, nonpeptide antagonists have been developed that support this subtype classification. In the CNS, type B receptors regulate anxiety, arousal, neuroleptic activity, and opiate- induced analgesia. Outside the CNS, they regulate gastric acid secretion and may play a role in gastrointestinal motility and growth of normal and neoplastic gastrointestinal tissue. The CCKB/gastrin receptor (CCKBR) can selectively be blocked by nonpeptide benzodiazepine- based antagonists. Beinborn et al. (1993) found that a single amino acid, valine-319, is critical in determining the binding affinity for these nonpeptide antagonists. They showed that it is the variability in the aliphatic side chain of the amino acid in position 319 that confers antagonist specificity and concluded that the residues underlying nonpeptide antagonist affinity must differ from those that confer against specificity. Pisegna et al. (1992) used a rat type B receptor cDNA to isolate cDNA for the human counterpart. They found that it encodes a 447- amino acid protein with 90% identity to both rat type B CCK receptor and canine gastrin receptor. Northern hybridization identified transcripts in stomach, pancreas, brain, and gall bladder. Using a somatic cell hybrid panel of human/hamster DNAs and

Southern blot analysis, they demonstrated that the CCKBR gene is located on chromosome 11. Expression of the receptor of the cDNA in COS- 7 cells was characteristic of a type B CCK receptor pharmacology. Zimonjic et al. (1994) assigned the CCKBR gene to 11p15.5- p15.4 by in situ hybridization.

[3792]

[3793] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3794] Beinborn, M.; Lee, Y.- M.; McBride, E. W.; Quinn, S. M.; Kopin, A. S. : A single amino acid of the cholecystokinin- B/gastrin receptor determines specificity for non- peptide antagonists. Nature 362: 348- 350, 1993. ; and

[3795] Pisegna, J. R.; de Weerth, A.; Huppi, K.; Wank, S. A. : Molecular cloning of the human brain and gastric cholecystokinin receptor: structure, functional expression and chromosomal locali.

[3796] Further studies establishing the function and utilities of CCKBR are found in John Hopkins OMIM database record ID 118445, and in cited publications listed in Table 5, which are hereby incorporated by reference.Collagen-like tail subunit (single strand of homotrimer) of asymmetric

acetylcholinesterase (COLQ, Accession NP_536803.1) is another GAM44 target gene, herein designated TARGET GENE. COLQ BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COLQ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COLQ BINDING SITE, designated SEQ ID:9718, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3797] Another function of GAM44 is therefore inhibition of Collagen-like tail subunit (single strand of homotrimer) of asymmetric acetylcholinesterase (COLQ, Accession NP_536803.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLQ.

[3798] Collagen-like tail subunit (single strand of homotrimer) of asymmetric acetylcholinesterase (COLQ, Accession NP_536804.1) is another GAM44 target gene, herein designated TARGET GENE. COLQ BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COLQ, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COLQ BINDING SITE, designated SEQ ID:9718, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3799] Another function of GAM44 is therefore inhibition of Collagen-like tail subunit (single strand of homotrimer) of asymmetric acetylcholinesterase (COLQ, Accession NP_536804.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLQ.

[3800] Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000564.1) is another GAM44 target gene, herein designated TARGET GENE. CR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CR1 BINDING SITE, designated SEQ ID:10491, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated

SEQ ID:287.

[3801] Another function of GAM44 is therefore inhibition of Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000564.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CR1.

[3802] Chemokine (c-x3-c motif) receptor 1 (CX3CR1, Accession NP_001328.1) is another GAM44 target gene, herein designated TARGET GENE. CX3CR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CX3CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:10405, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3803] Another function of GAM44 is therefore inhibition of Chemokine (c-x3-c motif) receptor 1 (CX3CR1, Accession NP_001328.1), a gene which mediates both the adhesive and migratory functions of fractalkine and therefore may be associated with Human immunodeficiency virus type 1.

Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Human immunodeficiency virus type 1., and of other diseases and clinical conditions associated with CX3CR1.

[3804] The function of CX3CR1 has been established by previous studies. Leukocyte trafficking at the endothelium requires both cellular adhesion molecules and chemotactic factors. Fractalkine (OMIM Ref. No. 601880), a transmembrane molecule with a CX3C- motif chemokine domain atop a mucin stalk, induces both adhesion and migration of leukocytes. Imai et al. (1997) identified a 7- transmembrane high- affinity receptor for fractalkine and showed that it mediates both the adhesive and migratory functions of fractalkine. The receptor, which the authors termed CX3CR1, requires pertussis toxin- sensitive G protein signaling to induce migration but not to support adhesion, which also occurs without other adhesion molecules but requires the architecture of a chemokine domain atop the mucin stalk. Natural killer cells predominantly express CX3CR1 and respond to fractalkine in both migration and adhesion. Imai et al. (1997) concluded that fractalkine and CX3CR1 represent new types of leukocyte trafficking regulators, performing both adhesive and

chemotactic functions. CX3CR1 is an HIV coreceptor as well as a leukocyte chemotactic/adhesion receptor for fractalkine. Faure et al. (2000) identified 2 single nucleotide polymorphisms in the CX3CR1 gene in Caucasians and demonstrated that HIV- infected patients homozygous for I249/M280 (601470.0001) progressed to AIDS more rapidly than those with other haplotypes (relative risk = 2.13, P = 0.039). Functional CX3CR1 analysis showed that fractalkine binding is reduced among patients homozygous for this particular haplotype. Thus, Faure et al. (2000) concluded that CX3CR1- I249/M280 is a recessive genetic risk factor for HIV/AIDS. Tripp et al. (2001) showed that the G glycoprotein of respiratory syncytial virus (RSV) shares a heparin- binding domain and a CX3C chemokine motif with CX3CL1. Binding analysis indicated that RSV can use CX3CR1 as a receptor. G glycoprotein binding mimics fractalkine binding and induces leukocyte chemotaxis. Tripp et al. (2001) concluded that RSV G glycoprotein uses its similarities with CX3C to facilitate infection and to modify the immune response.

[3805]

[3806] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[3807] Faure, S.; Meyer, L.; Costagliola, D.; Vaneensberghe, C.; Genin, E.; Autran, B.; French ALT and IMMUNOCO Study Groups; Delfraisay, J.- F.; SEROCO Study Group; McDermott, D. H.; Murphy, P. M.; Debre, P.; Theodorou, I.; Cambadiere, C. : Rapid progression to AIDS in HIV+ individuals with a structural variant of the chemokine receptor CX(3)CR1. Science 287: 2274- 2277, 2000. ; and

[3808] Moatti, D.; Faure, S.; Fumeron, F.; Amara, M. E. W.; Seknadji, P.; McDermott, D. H.; Debre, P.; Aumont, M. C.; Murphy, P. M.; de Prost, D.; Combadiere, C. : Polymorphism in the fractalk.

[3809] Further studies establishing the function and utilities of CX3CR1 are found in John Hopkins OMIM database record ID 601470, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cylindromatosis (turban tumor syndrome) (CYLD, Accession NP_056062.1) is another GAM44 target gene, herein designated TARGET GENE. CYLD BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CYLD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of CYLD BINDING SITE, designated SEQ ID:11043, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3810] Another function of GAM44 is therefore inhibition of Cylindromatosis (turban tumor syndrome) (CYLD, Accession NP_056062.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLD.

[3811] 24-dehydrocholesterol reductase (DHCR24, Accession NP_055577.1) is another GAM44 target gene, herein designated TARGET GENE. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHCR24 BINDING SITE, designated SEQ ID:14070, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3812] Another function of GAM44 is therefore inhibition of 24-dehydrocholesterol reductase (DHCR24, Accession NP_055577.1), a gene which catalyzes the reduction of

sterol intermediates. and therefore is associated with Desmosterolosis. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Desmosterolosis., and of other diseases and clinical conditions associated with DHCR24.

[3813] The function of DHCR24 has been established by previous studies. Sarkar et al. (2001) showed that the gene encoding seladin- 1, a human homolog of the Diminuto/Dwarf1 gene described in plants and C. elegans, has adenoma-specific overexpression. Northern blot analysis revealed that seladin- 1 mRNA was overexpressed in the adenoma tissue of 14 patients with Cushing syndrome in comparison to the adjacent nontumorous adrenal gland. In situ hybridization using a seladin- 1 cRNA probe showed its abundant expression in the tumor cells, whereas the nontumorous cells showed a low level of expression. Almost no apoptotic cell was detected in the tumor or in the normal adrenal cortex where seladin- 1 expression was abundant. The authors noted that their results were compatible with a recent report that seladin- 1 acts as an antiapoptotic factor in neurons (Greeve et al., 2000). In addition, expression of seladin- 1 in the normal adrenal cortex was most abundant in the zona fasciculata, suggest-

ing its possible regulation by ACTH/cAMP. The authors concluded that the overexpression of seladin- 1 in the adenoma could be due to the abundant expression of ACTH receptor and hypothesized that seladin- 1 might be involved in the molecular events of adrenocortical tumorigenesis by facilitating steroid synthesis and cell growth. In a severely affected infant with desmosterolosis (OMIM Ref. No. 602398), Waterham et al. (2001) identified 3 mutations in the DHCR24 gene. The mutation inherited from the mother was a 1412A- C change resulting in a tyr471- to- ser (Y471S) substitution. Expression studies in S. cerevisiae showed nondetectable activity of this variant, consistent with the severe phenotype of the patient. Two mutations on the same allele were inherited from the father: an 881A- C change resulting in an asn294- to- thr substitution (N294T), and a 918G- C change resulting in a lys306- to- asn (K306N) substitution (606418.0002). Expression studies in S. cerevisiae of the N294T and K306N variants showed 14.4% and 49.8% of wildtype activity, respectively. Expression studies in S. cerevisiae of an allele with both mutations from the father showed less than 1% of wildtype activity. To determine whether one of the mutations inherited from the father was a common polymor-

phic variant, 50 alleles of controls were analyzed but neither mutation was detected.

[3814]

[3815] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3816] Sarkar, D.; Imai, T.; Kambe, F.; Shibata, A.; Ohmori, S.; Siddiq, A.; Hayasaka, S.; Funahashi, H.; Seo, H. : The human homolog of Diminuto/Dwarf1 gene (hDiminuto): a novel ACTH- responsive gene overexpressed in benign cortisol- producing adrenocortical adenomas. J. Clin. Endocr. Metab. 86: 5130- 5137, 2001. ; and

[3817] Greeve, I.; Hermans- Borgmeyer, I.; Brellinger, C.; Kasper, D.; Gomez- Isla, T.; Behl, C.; Levkau, B.; Nitsch, R. M. : The human DIMINUTO/DWARF1 homolog seladin- 1 confers resistance to A.

[3818] Further studies establishing the function and utilities of DHCR24 are found in John Hopkins OMIM database record ID 606418, and in cited publications listed in Table 5, which are hereby incorporated by reference.DIRAS2 (Accession NP_060064.2) is another GAM44 target gene, herein designated TARGET GENE. DIRAS2 BINDING SITE1 and DIRAS2 BINDING SITE2 are target binding sites found

in untranslated regions of mRNA encoded by DIRAS2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIRAS2 BINDING SITE1 and DIRAS2 BINDING SITE2, designated SEQ ID:16186 and SEQ ID:14097 respectively, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3819] Another function of GAM44 is therefore inhibition of DIRAS2 (Accession NP_060064.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIRAS2.

[3820] DKFZp547I094 (Accession NP_115531.1) is another GAM44 target gene, herein designated TARGET GENE. DKFZp547I094 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp547I094, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, designated SEQ ID:2790, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3821] Another function of GAM44 is therefore inhibition of DKFZp547I094 (Accession NP_115531.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I094.

[3822] DKFZP564O0423 (Accession XP_166254.2) is another GAM44 target gene, herein designated TARGET GENE. DKFZP564O0423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:1156, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3823] Another function of GAM44 is therefore inhibition of DKFZP564O0423 (Accession XP_166254.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423.

[3824] DKFZP586F2423 (Accession XP_291242.1) is another GAM44 target gene, herein designated TARGET GENE. DK-

FZP586F2423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586F2423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586F2423 BINDING SITE, designated SEQ ID:12701, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3825] Another function of GAM44 is therefore inhibition of DKFZP586F2423 (Accession XP_291242.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F2423.

[3826] DKFZp761B107 (Accession NP_775734.1) is another GAM44 target gene, herein designated TARGET GENE. DKFZp761B107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761B107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B107 BINDING SITE, designated SEQ ID:19365, to the nucleotide sequence of

GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3827] Another function of GAM44 is therefore inhibition of DKFZp761B107 (Accession NP_775734.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B107.

[3828] E2f transcription factor 3 (E2F3, Accession NP_001940.1) is another GAM44 target gene, herein designated TARGET GENE. E2F3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by E2F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:13295, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3829] Another function of GAM44 is therefore inhibition of E2f transcription factor 3 (E2F3, Accession NP_001940.1), a gene which binds dna and controls cell- cycle progression from g1 to s phase. and therefore may be associated with Hereditary autosomal dominant myoclonus dystonia. Accordingly, utilities of GAM44 include diagnosis, prevention

and treatment of Hereditary autosomal dominant myoclonus dystonia, and of other diseases and clinical conditions associated with E2F3.

[3830] The function of E2F3 has been established by previous studies. MYC (OMIM Ref. No. 190080) induces transcription of the E2F1, E2F2 (OMIM Ref. No. 600426), and E2F3 genes. Using primary mouse embryo fibroblasts deleted for individual E2f genes, Leone et al. (2001) showed that MYC- induced S phase and apoptosis requires distinct E2F activities. The ability of Myc to induce S phase was impaired in the absence of either E2f2 or E2f3 but not E2f1 or E2f4 (OMIM Ref. No. 600659). In contrast, the ability of Myc to induce apoptosis was markedly reduced in cells deleted for E2f1 but not E2f2 or E2f3. The authors proposed that the induction of specific E2F activities is an essential component in the MYC pathways that control cell proliferation and cell fate decisions.

[3831] Animal model experiments lend further support to the function of E2F3. Cloud et al. (2002) generated E2f3- null mice. They found that E2f3 was essential for embryonic viability in the pure 129/Sv background, but that the presence of C57BL/6 alleles yielded some adult survivors. Although growth retarded, surviving E2f3 - /- animals

were initially healthy and exhibited no obvious tumor phenotype. They died prematurely, however, with signs typical of congestive heart failure, a defect completely distinct from those reported in E2f1- null mice. Cloud et al. (2002) also generated E2f1/E2f3 compound mutant mice and found that almost all of the developmental and age- related defects arising in the individual E2f1- or E2f3- null mice were exacerbated by the mutation of the other E2f. One major difference in the properties of E2f1 and E2f3 loss was that, either alone or in combination with loss of E2f1, E2f3 mutants did not show an increase in the incidence of tumor formation.

[3832] It is appreciated that the abovementioned animal model for E2F3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3833] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3834] Leone, G.; Sears, R.; Huang, E.; Rempel, R.; Nuckolls, F.; Park, C.- H.; Giangrande, P.; Wu, L.; Saavedra, H. I.; Field, S. J.; Thompson, M. A.; Yang, H.; Fujiwara, Y.; Greenberg, M. E.; Orkin, S.; Smith, C.; Nevins, J. R. : Myc requires dis-

tinct E2F activities to induce S phase and apoptosis. Molec. Cell 8: 105- 113, 2001. ; and

[3835] Cloud, J. E.; Rogers, C.; Reza, T. L.; Ziebold, U.; Stone, J. R.; Picard, M. H.; Caron, A. M.; Bronson, R. T.; Lees, J. A. : Mutant mouse models reveal the relative roles of E2F1 and E2.

[3836] Further studies establishing the function and utilities of E2F3 are found in John Hopkins OMIM database record ID 600427, and in cited publications listed in Table 5, which are hereby incorporated by reference.Endothelial differentiation, lysophosphatidic acid g-protein-coupled receptor, 2 (EDG2, Accession NP_476500.1) is another GAM44 target gene, herein designated TARGET GENE. EDG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EDG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG2 BINDING SITE, designated SEQ ID:10299, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3837] Another function of GAM44 is therefore inhibition of Endothelial differentiation, lysophosphatidic acid g-

protein-coupled receptor, 2 (EDG2, Accession NP_476500.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG2.

[3838] Endothelial differentiation, lysophosphatidic acid g-protein-coupled receptor, 2 (EDG2, Accession NP_001392.2) is another GAM44 target gene, herein designated TARGET GENE. EDG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EDG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG2 BINDING SITE, designated SEQ ID:10299, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3839] Another function of GAM44 is therefore inhibition of Endothelial differentiation, lysophosphatidic acid g-protein-coupled receptor, 2 (EDG2, Accession NP_001392.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG2.

[3840] Fk506 binding protein 2, 13kda (FKBP2, Accession

NP_004461.2) is another GAM44 target gene, herein designated TARGET GENE. FKBP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FKBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP2 BINDING SITE, designated SEQ ID:11911, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3841] Another function of GAM44 is therefore inhibition of Fk506 binding protein 2, 13kda (FKBP2, Accession NP_004461.2), a gene which ppiases accelerate the folding of proteins. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP2.

[3842] The function of FKBP2 has been established by previous studies. See 186945. DiLella et al. (1992) found that the FKBP2 gene is 3 kb long and contains 6 exons. By fluorescence in situ hybridization, they mapped the gene to 11q13.1- q13.3. Jin et al. (1991) reported the cloning and subcellular localization of a 13- kD FK506- binding protein (OMIM Ref. No. FKBP13), which has a 21- amino acid

signal peptide and appears to be membrane- associated. The 120- amino acid mature protein appears to lack a transmembrane domain but a potential endoplasmic reticulum retention sequence (Arg- Thr- Glu- Leu) is found at its C- terminus. FKBP13 has 51% nucleotide sequence identity and 43% amino acid sequence identity to FKBP12 (OMIM Ref. No. 186945). Jin et al. (1991) noted that conserved residues that comprise the drug binding site and rotamase active site of FKBP12 are completely conserved in FKBP13. Courseaux et al. (1996) used a combination of methods to refine maps of the approximately 5- Mb region of 11q13 that includes MEN1 (OMIM Ref. No. 131100). They proposed the following gene order: cen- - PGA- - FTH1- - UGB- - AHNAK- - ROM1- - MDU1- - CHRM1- - COX8- - EMK1- - FKBP2- - PLCB3- - [PYGM, ZFM1]- - FAU- - CAPN1- - [MLK3, RELA]- - FOSL1- - SEA- - CFL1- - tel.

[3843]

[3844] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3846] DiLella, A. G.; Hawkins, A.; Craig, R. J.; Schreiber, S. L.; Griffin, C. A. : Chromosomal band assignments of the genes encoding human FKBP12 and FKBP13. Biochem. Biophys. Res. Commun.

[3847] Further studies establishing the function and utilities of FKBP2 are found in John Hopkins OMIM database record ID 186946, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fk506 binding protein 2, 13kda (FKBP2, Accession NP_476433.1) is another GAM44 target gene, herein designated TARGET GENE. FKBP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FKBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP2 BINDING SITE, designated SEQ ID:11911, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3848] Another function of GAM44 is therefore inhibition of Fk506 binding protein 2, 13kda (FKBP2, Accession NP_476433.1), a gene which ppiases accelerate the folding of proteins. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP2.

[3849] The function of FKBP2 has been established by previous studies. See 186945. DiLella et al. (1992) found that the FKBP2 gene is 3 kb long and contains 6 exons. By fluorescence in situ hybridization, they mapped the gene to 11q13.1- q13.3. Jin et al. (1991) reported the cloning and subcellular localization of a 13- kD FK506- binding protein (OMIM Ref. No. FKBP13), which has a 21- amino acid signal peptide and appears to be membrane- associated. The 120- amino acid mature protein appears to lack a transmembrane domain but a potential endoplasmic reticulum retention sequence (Arg- Thr- Glu- Leu) is found at its C- terminus. FKBP13 has 51% nucleotide sequence identity and 43% amino acid sequence identity to FKBP12 (OMIM Ref. No. 186945). Jin et al. (1991) noted that conserved residues that comprise the drug binding site and rotamase active site of FKBP12 are completely conserved in FKBP13. Courseaux et al. (1996) used a combination of

methods to refine maps of the approximately 5- Mb region of 11q13 that includes MEN1 (OMIM Ref. No. 131100). They proposed the following gene order: cen- - PGA- - FTH1- - UGB- - AHNAK- - ROM1- - MDU1- - CHRM1- - COX8- - EMK1- - FKBP2- - PLCB3- - [PYGM, ZFM1]- - FAU- - CAPN1- - [MLK3, RELA]- - FOSL1- - SEA- - CFL1- - tel.

[3850]

[3851] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3852] Courseaux, A.; Grosgeorge, J.; Gaudray, P.; Pannett, A. A. J.; Forbes, S. A.; Williamson, C.; Bassett, D.; Thakker, R. V.; Teh, B. T.; Farnebo, F.; Shepherd, J.; Skogseid, B.; Larsson, C.; Giraud, S.; Zhang, C. X.; Salandre, J.; Calender, A. : Definition of the minimal MEN1 candidate area based on a 5- Mb integrated map of proximal 11q13. Genomics 37: 354- 365, 1996. ; and

[3853] DiLella, A. G.; Hawkins, A.; Craig, R. J.; Schreiber, S. L.; Griffin, C. A. : Chromosomal band assignments of the genes encoding human FKBP12 and FKBP13. Biochem. Biophys. Res. Commun.

[3854] Further studies establishing the function and utilities of

FKBP2 are found in John Hopkins OMIM database record ID 186946, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10945 (Accession NP_060750.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ10945 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10945, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10945 BINDING SITE, designated SEQ ID:3221, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3855] Another function of GAM44 is therefore inhibition of FLJ10945 (Accession NP_060750.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10945.

[3856] FLJ11730 (Accession NP_073593.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ11730 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11730, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ11730 BINDING SITE, designated SEQ ID:13471, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3857] Another function of GAM44 is therefore inhibition of FLJ11730 (Accession NP_073593.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11730.

[3858] FLJ11871 (Accession NP_079393.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ11871 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11871, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11871 BINDING SITE, designated SEQ ID:18221, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3859] Another function of GAM44 is therefore inhibition of FLJ11871 (Accession NP_079393.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11871.

[3860] FLJ12425 (Accession XP_098290.1) is another GAM44 tar-

get gene, herein designated TARGET GENE. FLJ12425 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12425, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12425 BINDING SITE, designated SEQ ID:7079, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3861] Another function of GAM44 is therefore inhibition of FLJ12425 (Accession XP_098290.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12425.

[3862] FLJ12529 (Accession NP_079087.2) is another GAM44 target gene, herein designated TARGET GENE. FLJ12529 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12529 BINDING SITE, designated SEQ ID:17806, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3863] Another function of GAM44 is therefore inhibition of FLJ12529 (Accession NP_079087.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12529.

[3864] FLJ13089 (Accession NP_079229.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ13089 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13089, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13089 BINDING SITE, designated SEQ ID:10552, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3865] Another function of GAM44 is therefore inhibition of FLJ13089 (Accession NP_079229.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13089.

[3866] FLJ13848 (Accession NP_079047.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ13848 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13848, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:19252, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3867] Another function of GAM44 is therefore inhibition of FLJ13848 (Accession NP_079047.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848.

[3868] FLJ14721 (Accession NP_116218.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ14721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14721 BINDING SITE, designated SEQ ID:14879, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3869] Another function of GAM44 is therefore inhibition of FLJ14721 (Accession NP_116218.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14721.

[3870] FLJ20856 (Accession NP_079419.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ20856 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20856, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20856 BINDING SITE, designated SEQ ID:3537, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3871] Another function of GAM44 is therefore inhibition of FLJ20856 (Accession NP_079419.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20856.

[3872] FLJ21156 (Accession NP_078878.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ21156 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21156 BINDING SITE, designated SEQ ID:485, to the nucleotide sequence of GAM44 RNA, herein designated

GAM RNA, also designated SEQ ID:287.

[3873] Another function of GAM44 is therefore inhibition of FLJ21156 (Accession NP_078878.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21156.

[3874] FLJ23518 (Accession NP_079001.2) is another GAM44 target gene, herein designated TARGET GENE. FLJ23518 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23518, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23518 BINDING SITE, designated SEQ ID:11473, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3875] Another function of GAM44 is therefore inhibition of FLJ23518 (Accession NP_079001.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23518.

[3876] FLJ25534 (Accession NP_694966.2) is another GAM44 target gene, herein designated TARGET GENE. FLJ25534 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25534, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25534 BINDING SITE, designated SEQ ID:1034, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3877] Another function of GAM44 is therefore inhibition of FLJ25534 (Accession NP_694966.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25534.

[3878] FLJ30532 (Accession NP_653325.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ30532 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30532, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:1559, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3879] Another function of GAM44 is therefore inhibition of FLJ30532 (Accession NP_653325.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ30532.

[3880] FLJ32069 (Accession NP_694578.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ32069 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32069, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32069 BINDING SITE, designated SEQ ID:19969, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3881] Another function of GAM44 is therefore inhibition of FLJ32069 (Accession NP_694578.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32069.

[3882] FLJ32312 (Accession NP_653310.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ32312 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32312, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32312 BINDING SITE, designated SEQ ID:6992, to the

nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3883] Another function of GAM44 is therefore inhibition of FLJ32312 (Accession NP_653310.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32312.

[3884] FLJ34047 (Accession NP_775940.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ34047 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34047 BINDING SITE, designated SEQ ID:5426, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3885] Another function of GAM44 is therefore inhibition of FLJ34047 (Accession NP_775940.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34047.

[3886] FLJ39639 (Accession XP_290687.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ39639 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ39639, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39639 BINDING SITE, designated SEQ ID:7460, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3887] Another function of GAM44 is therefore inhibition of FLJ39639 (Accession XP_290687.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39639.

[3888] FLJ40288 (Accession NP_775953.1) is another GAM44 target gene, herein designated TARGET GENE. FLJ40288 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40288, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40288 BINDING SITE, designated SEQ ID:15256, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3889] Another function of GAM44 is therefore inhibition of FLJ40288 (Accession NP_775953.1) . Accordingly, utilities

of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40288.

[3890] Formin binding protein 4 (FNBP4, Accession NP_056123.1) is another GAM44 target gene, herein designated TARGET GENE. FNBP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FNBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FNBP4 BINDING SITE, designated SEQ ID:13556, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3891] Another function of GAM44 is therefore inhibition of Formin binding protein 4 (FNBP4, Accession NP_056123.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNBP4.

[3892] GAS8 (Accession NP_001472.1) is another GAM44 target gene, herein designated TARGET GENE. GAS8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAS8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of GAS8 BINDING SITE, designated SEQ ID:6978, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3893] Another function of GAM44 is therefore inhibition of GAS8 (Accession NP_001472.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS8.

[3894] Gata binding protein 2 (GATA2, Accession NP_116027.2) is another GAM44 target gene, herein designated TARGET GENE. GATA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GATA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:2059, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3895] Another function of GAM44 is therefore inhibition of Gata binding protein 2 (GATA2, Accession NP_116027.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2.

[3896] Glycosylphosphatidylinositol specific phospholipase d1 (GPLD1, Accession NP_001494.2) is another GAM44 target gene, herein designated TARGET GENE. GPLD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GPLD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPLD1 BINDING SITE, designated SEQ ID:17577, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3897] Another function of GAM44 is therefore inhibition of Glycosylphosphatidylinositol specific phospholipase d1 (GPLD1, Accession NP_001494.2), a gene which hydrolyses the inositol phosphate linkage in proteins anchored by phosphatidylinositol glycans to release these proteins from the membrane. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPLD1.

[3898] The function of GPLD1 has been established by previous studies. Many proteins are attached to the plasma membrane via a glycosylphosphatidylinositol (GPI) anchor. Phosphatidylinositol- glycan (PIG)- specific phospholi-

pases D (PLDs) selectively hydrolyze the inositol phosphate linkage, allowing release of the protein. Scallon et al. (1991) cloned a cDNA encoding a PIGPLD from a bovine liver cDNA library. The deduced amino acid sequence contains 4 regions of internal homology that are similar to the metal ion binding domains of integrin alpha subunits (see OMIM Ref. No. ITGA2, 192974). Bovine PIGPLD does not exhibit phosphatidylcholine- specific PLD (OMIM Ref. No. 602382) activity. By PCR and screening of a human liver cDNA library, Tsang et al. (1992) isolated a cDNA (OMIM Ref. No. L11701) encoding a PIGPLD. The protein product contains 841 amino acids, including a 24-residue signal sequence. Tsang et al. (1992) isolated a cDNA (OMIM Ref. No. L11702) encoding a related but distinct PIGPLD from a human pancreas cDNA library. The pancreas- derived PIGPLD contains 840 amino acids, including a 23- residue signal sequence. Schofield and Rademacher (2000) determined that the GPLD1 gene contains 25 exons and spans at least 80 kb. Northern blot analysis revealed expression of 5.8- kb transcript that was restricted to liver. Southern blot analysis indicated that GPLD1 is a single- copy gene.

[3899]

[3900] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3901] Schofield, J. N.; Rademacher, T. W. : Structure and expression of the human glycosylphosphatidylinositol phospholipase D1 (GPLD1) gene. Biochim. Biophys. Acta 1494: 189- 194, 2000. ; and

[3902] Tsang, T. C.; Fung, W.- J.; Levine, J.; Metz, C. N.; Davitz, M. A.; Burns, D. K.; Huang, K.- S.; Kochan, J. P. : Isolation and expression of two human glycosylphosphatidylinositol phospho.

[3903] Further studies establishing the function and utilities of GPLD1 are found in John Hopkins OMIM database record ID 602515, and in cited publications listed in Table 5, which are hereby incorporated by reference.G protein-coupled receptor 68 (GPR68, Accession NP_003476.1) is another GAM44 target gene, herein designated TARGET GENE. GPR68 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPR68, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR68 BINDING SITE, designated SEQ ID:4765,

to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3904] Another function of GAM44 is therefore inhibition of G protein-coupled receptor 68 (GPR68, Accession NP_003476.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR68.

[3905] G protein-coupled receptor 77 (GPR77, Accession NP_060955.1) is another GAM44 target gene, herein designated TARGET GENE. GPR77 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPR77, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR77 BINDING SITE, designated SEQ ID:2326, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3906] Another function of GAM44 is therefore inhibition of G protein-coupled receptor 77 (GPR77, Accession NP_060955.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR77.

[3907] GW112 (Accession NP_006409.2) is another GAM44 target

gene, herein designated TARGET GENE. GW112 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GW112, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:17202, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3908] Another function of GAM44 is therefore inhibition of GW112 (Accession NP_006409.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112.

[3909] Hepatitis a virus cellular receptor 1 (HAVCR1, Accession NP_036338.1) is another GAM44 target gene, herein designated TARGET GENE. HAVCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HAVCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAVCR1 BINDING SITE, designated SEQ ID:1838, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ

ID:287.

[3910] Another function of GAM44 is therefore inhibition of Hepatitis a virus cellular receptor 1 (HAVCR1, Accession NP_036338.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAVCR1.

[3911] Homeo box b7 (HOXB7, Accession NP_004493.2) is another GAM44 target gene, herein designated TARGET GENE. HOXB7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXB7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB7 BINDING SITE, designated SEQ ID:14802, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3912] Another function of GAM44 is therefore inhibition of Homeo box b7 (HOXB7, Accession NP_004493.2), a gene which is a member of homeodomain family of DNA binding proteins; may regulate gene expression, morphogenesis, and differentiation. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB7.

[3913] The function of HOXB7 has been established by previous studies. In mouse, Hoxb7 expression is confined to macrophages. Using RT- PCR, Lill et al. (1995) detected expression of HOXB7 in monocytes differentiated from HL60 cells by stimulation with vitamin D3. Overexpression of HOXB7 inhibited differentiation into granulocytes but not monocytes. However, RT- PCR analysis failed to detect HOXB7 expression in mature monocytes. HOX proteins have a conserved DNA- binding homeodomain, a pentapeptide motif that mediates interactions with PBX proteins (e.g., PBX1; 176310), and an N- terminal octapeptide motif. Yaron et al. (2001) found that wildtype HOXB7 inhibited differentiation of a murine myelomonocytic cell line, 32D, but that mutations in any of the conserved regions blocked this inhibitory effect. Mutations in casein kinase phosphorylation sites, the glutamate- rich C terminus, or the N- terminal 14 residues of HOXB7 enhanced 32D differentiation.

[3914]

[3915] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3916] Lill, M. C.; Fuller, J. F.; Herzig, R.; Crooks, G. M.; Gasson, J.

C. : The role of the homeobox gene, HOX B7, in human myelomonocytic differentiation. Blood 85: 692- 697, 1995. ; and

[3917] Yaron, Y.; McAdara, J. K.; Lynch, M.; Hughes, E.; Gasson, J. C. : Identification of novel functional regions important for the activity of HOXB7 in mammalian cells. J. Immun. 166: 5058- 5.

[3918] Further studies establishing the function and utilities of HOXB7 are found in John Hopkins OMIM database record ID 142962, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hermansky-pudlak syndrome 3 (HPS3, Accession NP_115759.2) is another GAM44 target gene, herein designated TARGET GENE. HPS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HPS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS3 BINDING SITE, designated SEQ ID:10776, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3919] Another function of GAM44 is therefore inhibition of Hermansky-pudlak syndrome 3 (HPS3, Accession

NP_115759.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS3.

[3920] HSPC133 (Accession NP_054887.1) is another GAM44 target gene, herein designated TARGET GENE. HSPC133 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC133 BINDING SITE, designated SEQ ID:19037, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3921] Another function of GAM44 is therefore inhibition of HSPC133 (Accession NP_054887.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC133.

[3922] HT001 (Accession NP_054784.1) is another GAM44 target gene, herein designated TARGET GENE. HT001 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HT001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of HT001 BINDING SITE, designated SEQ ID:2559, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3923] Another function of GAM44 is therefore inhibition of HT001 (Accession NP_054784.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT001.

[3924] ICK (Accession NP_057597.2) is another GAM44 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:4546, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3925] Another function of GAM44 is therefore inhibition of ICK (Accession NP_057597.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[3926] ICK (Accession NP_055735.1) is another GAM44 target

gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:4546, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3927] Another function of GAM44 is therefore inhibition of ICK (Accession NP_055735.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[3928] Insulin-like growth factor 2 receptor (IGF2R, Accession NP_000867.1) is another GAM44 target gene, herein designated TARGET GENE. IGF2R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF2R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF2R BINDING SITE, designated SEQ ID:11950, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3929] Another function of GAM44 is therefore inhibition of Insulin-like growth factor 2 receptor (IGF2R, Accession NP_000867.1), a gene which transport of phosphorylated lysosomal enzymes from the golgi complex and the cell surface to lysosomes. lysosomal enzymes bearing phosphomannosyl residues bind specifically to mannose- 6-phosphate receptors in the golgi apparatus and the resulting receptor- ligand complex is transported to an acidic prelyosomal compartment where the low ph mediates the dissociation of the complex. this receptor also binds insulin growth factor ii. and therefore may be associated with Hepatocellular carcinoma, somatic. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Hepatocellular carcinoma, somatic, and of other diseases and clinical conditions associated with IGF2R.

[3930] The function of IGF2R has been established by previous studies. The mannose 6- phosphate/insulin- like growth factor II receptor functions in the intracellular trafficking of lysosomal enzymes, the activation of the potent growth inhibitor, transforming growth factor beta, and the degradation of IGF2, a mitogen often overproduced in tumors. De Souza et al. (1995) demonstrated that 70% of human

hepatocellular tumors have loss of heterozygosity (LOH) at the M6P/IGF2R locus at 6q26. In a separate report, De Souza et al. (1995) described a mutation screen that identified point mutations in the remaining allele of 25% of human hepatocellular carcinomas with LOH. One mutation created an alternative splice site within an intron (corresponding to intron 40 in mouse) and resulted in a truncated receptor; 2 others (147280.0001, 147280.0002) gave rise to significant amino acid substitutions. These mutations provided evidence to the authors that the M6P/IGF2R gene functions as a tumor suppressor in human liver carcinogenesis. Souza et al. (1996) reported that the IGF2R gene contains a number of microsatellite repeats within its coding sequence. They demonstrated microsatellite instability in this gene in 12 of 92 gastrointestinal tumors studied which were replication/repair error- positive. Mutations occurred in 6 of the poorly differentiated tumors. They noted an anticorrespondence of IGF2R and TGFBR2 (OMIM Ref. No. 190182) mutations. Of 31 gastrointestinal lesions studied with IGF2R or TGFBR2 mutations, 90% (28) contained mutations in one or the other, but not both, of these genes. Souza et al. (1996) demonstrated that all but 1 of the mutations

occurred within an 8- polydeoxyguanine tract spanning nucleotides 4089- 4096 of the IGF2R coding sequence. In 1 case of gastric adenocarcinoma, mutation occurred in a polyCT tract spanning nucleotides 6169- 6180. These mutations all comprised 1- or 2- bp deletions or insertions within the microsatellite region, causing frameshifts and premature stop codons downstream. Souza et al. (1996) noted that the TGFBR2 gene is also subject to microsatellite instability within its coding region. They noted further that IGF2R and TGFBR2 genes comprise serial points in the same tumorigenesis pathway, since mutation of either gene alone occurred in 90% of the gastrointestinal tumors that they analyzed. To facilitate genetic analyses of the imprint status of human M6P/IGF2R and loss of heterozygosity at this locus in cancer, Killian et al. (2001) screened American and Japanese populations for M6P/IGF2R single nucleotide polymorphisms (SNPs). They identified 9 novel intragenic SNPs and 3 amino acid variants in the ligand- binding domains of M6P/IGF2R that may be under selection in humans

[3931] Animal model experiments lend further support to the function of IGF2R. To determine whether paternal expression of the Igf2r gene is necessary for early development

in the mouse, Lau et al. (1994) derived mice in which the gene had been disrupted by targeted mutagenesis in embryonic stem (ES) cells with the subsequent introduction of the mutation into the germline of mice. Lau et al. (1994) found that murine embryos that inherit a nonfunctional Igf2r gene from their father are viable and develop normally into adults; however, most mice inheriting the same mutated allele from their mothers die around the time of birth as a consequence of major cardiac abnormalities. The mice that inherit the mutant allele from their mothers do not express Igf2r in their tissues, are 25 to 30% larger than their normal sibs, have elevated levels of circulating IGF2 and IGF- binding proteins, and exhibit a slight kink in the tail. The findings of overgrowth may support the suggestion that relaxation of maternal imprinting of IGF2 plays a role in the features of Beckwith-Wiedemann syndrome (OMIM Ref. No. 130650) (Feinberg, 1993).

[3932] It is appreciated that the abovementioned animal model for IGF2R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3933] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[3934] Lau, M. M. H.; Stewart, C. E. H.; Liu, Z.; Bhatt, H.; Rotwein, P.; Stewart, C. L. : Loss of the imprinted IGF2/cation- independent mannose 6- phosphate receptor results in fetal overgrowth and perinatal lethality. Genes Dev. 8: 2953-2963, 1994. ; and

[3935] Sleutels, F.; Zwart, R.; Barlow, D. P. : The non- coding Air RNA is required for silencing autosomal imprinted genes. Nature 415: 810- 813, 2002.

[3936] Further studies establishing the function and utilities of IGF2R are found in John Hopkins OMIM database record ID 147280, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) is another GAM44 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:3043, to the nucleotide sequence of GAM44 RNA,

herein designated GAM RNA, also designated SEQ ID:287.

[3937] Another function of GAM44 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[3938] IMMP2L (Accession NP_115938.1) is another GAM44 target gene, herein designated TARGET GENE. IMMP2L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IMMP2L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IMMP2L BINDING SITE, designated SEQ ID:2346, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3939] Another function of GAM44 is therefore inhibition of IMMP2L (Accession NP_115938.1), a gene which is a HOMOLOG of YEAST INNER MITOCHONDRIAL MEMBRANE PEPTIDASE. and therefore may be associated with Tourette syndrome. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Tourette syndrome, and of other diseases and clinical conditions associated

with IMMP2L.

[3940] The function of IMMP2L has been established by previous studies. In a patient with Gilles de la Tourette syndrome (GTS; 137580) and a de novo duplication of a segment of the long arm of chromosome 7, Petek et al. (2001) found that a distal chromosomal breakpoint occurred between 2 markers that define a region previously shown to be disrupted in a case of GTS (Boghosian- Sell et al., 1996). By further study, Petek et al. (2001) found that a novel gene, which they designated IMMP2L, that encodes the homolog of the yeast inner mitochondrial membrane peptidase subunit- 2 (Imp2) was disrupted by both the breakpoint in the duplicated fragment and the insertion site in 7q31. The 175- amino acid human IMMP2L protein is 41% identical to the yeast protein and 90% identical to the mouse protein. RT- PCR analysis detected IMMP2L expression in all tissues tested except adult liver and lung. The IMMP2L gene contains 6 exons and spans 860 kb

[3941]

[3942] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3943] Boghosian- Sell, L.; Comings, D. E.; Overhauser, J. :

Tourette syndrome in a pedigree with a 7;18 translocation: identification of a YAC spanning the translocation breakpoint at 18q22.3. Am. J. Hum. Genet. 59: 999-1005, 1996. ; and

[3944] Petek, E.; Windpassinger, C.; Vincent, J. B.; Cheung, J.; Boright, A. P.; Scherer, S. W.; Kroisel, P. M.; Wagner, K. : Disruption of a novel gene (IMMP2L) by a breakpoint in 7q31 associ.

[3945] Further studies establishing the function and utilities of IMMP2L are found in John Hopkins OMIM database record ID 605977, and in cited publications listed in Table 5, which are hereby incorporated by reference.Inositol polyphosphate-5-phosphatase, 72kda (INPP5E, Accession NP_063945.1) is another GAM44 target gene, herein designated TARGET GENE. INPP5E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INPP5E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INPP5E BINDING SITE, designated SEQ ID:17360, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3946] Another function of GAM44 is therefore inhibition of Inos-

itol polyphosphate-5-phosphatase, 72kda (INPP5E, Accession NP_063945.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5E.

[3947] Il2-inducible t-cell kinase (ITK, Accession NP_005537.3) is another GAM44 target gene, herein designated TARGET GENE. ITK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ITK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:1134, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3948] Another function of GAM44 is therefore inhibition of Il2-inducible t-cell kinase (ITK, Accession NP_005537.3), a gene which plays a role in t cell proliferation and differentiation. and therefore may be associated with Myelodysplastic syndrome. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Myelodysplastic syndrome, and of other diseases and clinical conditions associated with ITK.

[3949] The function of ITK has been established by previous

studies. Signal transduction through the T- cell receptor (TCR; OMIM Ref. No. 186880) and cytokine receptors on the surface of T lymphocytes occurs largely via tyrosine phosphorylation of intracellular substrates. Signal transduction is thought to occur via association of these receptors with intracellular protein tyrosine kinases. To identify unique T- cell tyrosine kinases, Gibson et al. (1993) used PCR- based cloning with degenerate oligonucleotides directed at highly conserved motifs of tyrosine kinase domains. In this way, they cloned the complete cDNA for a unique human tyrosine kinase that is expressed mainly in T lymphocytes and natural killer (NK) cells. The cDNA predicted an open reading frame of 1,866 bp encoding a protein with a predicted size of 72 kD, which was in keeping with its size on Western blotting. A single 6.2- kb mRNA and 72- kD protein were detected in T lymphocytes and NK- like cell lines, but were not detected in other cell lineages. Sequence comparisons suggested that the protein is probably the human homolog of a murine interleukin- 2- inducible T- cell kinase (ITK). However, unlike ITK, the message and protein levels for the new entity did not vary markedly on stimulation of human IL- 2 responsive T cells with IL- 2. They referred to the gene and its

protein product as EMT ('expressed mainly in T cells'). They concluded that EMT is a member of a new family of intracellular kinases that includes BPK (the kinase mutant in X- linked agammaglobulinemia, 300300). The expression of EMT message and protein in thymocytes and mature T cells, combined with its homology to BPK and its chromosomal localization, suggested that EMT may play a role in thymic ontogeny and growth regulation of mature T cells. Integrin adhesion receptors mediate critical interactions of T cells with other cells and extracellular matrix components during trafficking, as well as during antigen-specific recognition events in tissue. Phosphatidylinositol 3- kinase (PI3K; OMIM Ref. No. 601232) has a role in the regulation of integrin activity by CD3 (see OMIM Ref. No. 186790)- TCR and in the regulation of ITK. Woods et al. (2001) determined that TCR- mediated activation of beta-1 integrins (see OMIM Ref. No. ITGB1; 135630) requires activation of ITK and PI3K- dependent recruitment of ITK to detergent- insoluble glycosphingolipid- enriched microdomains (DIGs) via binding of the pleckstrin homology domain of ITK to the PI3K product PI(3,4,5)- P3. Likewise, activation of PI3K and LCK (OMIM Ref. No. 153390) via CD4 (OMIM Ref. No. 186940) coreceptor stimulation can

initiate beta- 1 integrin activation dependent on ITK function. CD4 stimulation, together with targeting of ITK to DIGs, also activates TCR- independent beta- 1 integrin function. Changes in beta- 1 integrin function mediated by TCR- induced activation of ITK are accompanied by ITK- dependent modulation of the actin cytoskeleton. Woods et al. (2001) concluded that TCR- mediated activation of beta- 1 integrin involves membrane relocalization and activation of ITK via coordinate action of PI3K and an SRC family tyrosine kinase.

[3950] Animal model experiments lend further support to the function of ITK. By homologous recombination, Schaeffer et al. (1999) disrupted the Rlk (TXK; 600058) gene in mice. Heterozygotes were completely normal. Homozygous null Rlk mice showed increased amounts of Itk mRNA. The authors hypothesized that upregulation of related Tec kinases may partially compensate for the lack of Rlk. Schaeffer et al. (1999) therefore generated Rlk - /- Itk - /- mice by interbreeding. Itk- deficient mice have reduced numbers of mature T cells, particularly CD4+ cells, causing a decreased CD4- to- CD8 ratio. Rlk - /- Itk - /- mutants, however, had normal T cell numbers. Both CD4+ and CD8+ cell numbers are increased relative to Itk - /-

mice. The persistent abnormal ratio of CD4+ to CD8+ cells suggested an altered regulation of lymphoid development and homeostasis in the double mutants. The double mutants had marked defects in T- cell receptor responses including proliferation, cytokine production, and apoptosis in vitro and adaptive immune responses to Toxoplasma gondii in vivo. Molecular events immediately downstream from the T- cell receptor were intact in Rlk - /- Itk - /- cells, but intermediate events including inositol trisphosphate production, calcium mobilization, and mitogen- activated protein kinase activation were impaired, establishing Tec kinases as critical regulators of T- cell receptor signaling required for phospholipase C- gamma activation.

[3951] It is appreciated that the abovementioned animal model for ITK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3952] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3953] Schaeffer, E. M.; Debnath, J.; Yap, G.; McVicar, D.; Liao, X. C.; Littman, D. R.; Sher, A.; Varmus, H. E.; Lenardo, M. J.;

Schwartzberg, P. L. : Requirement for Tec kinases Rlk and Itk in T cell receptor signaling and immunity. Science 284: 638- 641, 1999. ; and

[3954] Woods, M. L.; Kivens, W. J.; Adelsman, M. A.; Qiu, Y.; August, A.; Shimizu, Y. : A novel function for the Tec family tyrosine kinase Itk in activation of beta- 1 integrins by the T- cell.

[3955] Further studies establishing the function and utilities of ITK are found in John Hopkins OMIM database record ID 186973, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0391 (Accession NP_055487.1) is another GAM44 target gene, herein designated TARGET GENE. KIAA0391 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0391, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:728, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3956] Another function of GAM44 is therefore inhibition of KIAA0391 (Accession NP_055487.1) . Accordingly, utilities

of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391.

[3957] KIAA0523 (Accession XP_041964.5) is another GAM44 target gene, herein designated TARGET GENE. KIAA0523 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:2007, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3958] Another function of GAM44 is therefore inhibition of KIAA0523 (Accession XP_041964.5) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523.

[3959] KIAA0789 (Accession XP_033113.1) is another GAM44 target gene, herein designated TARGET GENE. KIAA0789 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0789, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:1640, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3960] Another function of GAM44 is therefore inhibition of KIAA0789 (Accession XP_033113.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789.

[3961] KIAA0984 (Accession XP_037557.2) is another GAM44 target gene, herein designated TARGET GENE. KIAA0984 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0984, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0984 BINDING SITE, designated SEQ ID:12474, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3962] Another function of GAM44 is therefore inhibition of KIAA0984 (Accession XP_037557.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0984.

[3963] KIAA1332 (Accession XP_048774.2) is another GAM44 target gene, herein designated TARGET GENE. KIAA1332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:12318, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3964] Another function of GAM44 is therefore inhibition of KIAA1332 (Accession XP_048774.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332.

[3965] KIAA1684 (Accession XP_290806.1) is another GAM44 target gene, herein designated TARGET GENE. KIAA1684 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1684, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1684 BINDING SITE, designated SEQ ID:12907, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3966] Another function of GAM44 is therefore inhibition of KIAA1684 (Accession XP_290806.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1684.

[3967] KIAA1720 (Accession NP_085148.1) is another GAM44 target gene, herein designated TARGET GENE. KIAA1720 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1720, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1720 BINDING SITE, designated SEQ ID:15787, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3968] Another function of GAM44 is therefore inhibition of KIAA1720 (Accession NP_085148.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1720.

[3969] KIAA1920 (Accession XP_085210.1) is another GAM44 target gene, herein designated TARGET GENE. KIAA1920 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1920 BINDING SITE, designated SEQ ID:8388, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3970] Another function of GAM44 is therefore inhibition of KIAA1920 (Accession XP_085210.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1920.

[3971] KIAA1946 (Accession NP_803237.1) is another GAM44 target gene, herein designated TARGET GENE. KIAA1946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1946 BINDING SITE, designated SEQ ID:8568, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3972] Another function of GAM44 is therefore inhibition of KIAA1946 (Accession NP_803237.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946.

[3973] Karyopherin alpha 6 (importin alpha 7) (KPNA6, Accession NP_036448.1) is another GAM44 target gene, herein designated TARGET GENE. KPNA6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KPNA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:16094, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3974] Another function of GAM44 is therefore inhibition of Karyopherin alpha 6 (importin alpha 7) (KPNA6, Accession NP_036448.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6.

[3975] Like-glycosyltransferase (LARGE, Accession NP_598397.1) is another GAM44 target gene, herein designated TARGET GENE. LARGE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LARGE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LARGE BINDING SITE, designated SEQ ID:14179, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3976] Another function of GAM44 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NP_598397.1), a gene which is a member of the N- acetylglucosaminyltransferase family. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE.

[3977] The function of LARGE has been established by previous studies. Peyrard et al. (1999) investigated the gene content of a segment of 22q12.3- q13.1 that had been shown to contain meningioma- related genes (OMIM Ref. No. 156100) on the basis of studies of deletions. They characterized a new member of the N- acetylglucosaminyltrans-

ferase gene family, which they designated the LARGE gene. The LARGE gene spans more than 664 kb of genomic DNA, making it the fifth largest in the human genome, after dystrophin (DMD; 300377), with 2.3 Mb; DCC (OMIM Ref. No. 120470), with 1.4 Mb; GRM8 (OMIM Ref. No. 601116), with 1 Mb; and utrophin (UTRN; 128240), with 900 kb. The LARGE gene contains 16 exons (4,326- bp cDNA) and has an exon content of less than 0.66%, which is similar to the exon content of the DMD gene (0.6%). The chromosomal segment of 22q containing the LARGE gene is apparently poor in genes. By fluorescence in situ hybridization, Peyrard et al. (1999) mapped the mouse Large gene to 8C1 in a region of conserved synteny with 22q12.3- q13.1. The expression pattern of the human and mouse LARGE orthologs is similar. Both genes are expressed ubiquitously, consistent with their function as housekeeping genes. These genes are also evolutionarily well conserved, as Peyrard et al. (1999) identified an ortholog in C. elegans encoding a polypeptide that is 33% identical with the human protein. Michele et al. (2002) demonstrated in both muscle- eye- brain disease (OMIM Ref. No. 253280) and Fukuyama congenital muscular dystrophy (FCMD; 253800) patients that alpha-

dystroglycan is expressed at the muscle membrane, but similar hypoglycosylation in the diseases directly abolishes binding activity of dystroglycan for the ligands laminin (see OMIM Ref. No. 150240), neurexin (see OMIM Ref. No. 600565), and agrin (OMIM Ref. No. 103320). Michele et al. (2002) showed that this posttranslational biochemical and functional disruption of alpha- dystroglycan is recapitulated in the muscle and central nervous system of myd mice. Michele et al. (2002) demonstrated that myd mice have abnormal neuronal migration in the cerebral cortex, cerebellum, and hippocampus, and show disruption of the basal lamina. In addition, myd mice reveal that dystroglycan targets proteins to functional sites in brain through its interactions with extracellular matrix proteins. Michele et al. (2002) suggested that at least 3 mammalian genes function within a convergent posttranslational processing pathway during the biosynthesis of dystroglycan and that abnormal dystroglycan- ligand interactions underlie the pathogenic mechanism of muscular dystrophy with brain abnormalities.

[3978] Animal model experiments lend further support to the function of LARGE. Michele et al. (2002) demonstrated in both muscle- eye- brain disease (OMIM Ref. No. 253280)

and Fukuyama congenital muscular dystrophy (FCMD; 253800) patients that alpha- dystroglycan is expressed at the muscle membrane, but similar hypoglycosylation in the diseases directly abolishes binding activity of dystroglycan for the ligands laminin (see OMIM Ref. No. 150240), neurexin (see OMIM Ref. No. 600565), and agrin (OMIM Ref. No. 103320). Michele et al. (2002) showed that this posttranslational biochemical and functional disruption of alpha- dystroglycan is recapitulated in the muscle and central nervous system of myd mice. Michele et al. (2002) demonstrated that myd mice have abnormal neuronal migration in the cerebral cortex, cerebellum, and hippocampus, and show disruption of the basal lamina. In addition, myd mice reveal that dystroglycan targets proteins to functional sites in brain through its interactions with extracellular matrix proteins. Michele et al. (2002) suggested that at least 3 mammalian genes function within a convergent posttranslational processing pathway during the biosynthesis of dystroglycan and that abnormal dystroglycan- ligand interactions underlie the pathogenic mechanism of muscular dystrophy with brain abnormalities.

[3979] It is appreciated that the abovementioned animal model

for LARGE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3980] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3981] Grewal, P. K.; Holzfeind, P. J.; Bittner, R. E.; Hewitt, J. E. : Mutant glycosyltransferase and altered glycosylation of alpha- dystroglycan in the myodystrophy mouse. Nature Genet. 28: 151- 154, 2001. ; and

[3982] Michele, D. E.; Barresi, R.; Kanagawa, M.; Saito, F.; Cohn, R. D.; Satz, J. S.; Dollar, J.; Nishino, I.; Kelley, R. I.; Somer, H.; Straub, V.; Mathews, K. D.; Moore, S. A.; Campbell, K.

[3983] Further studies establishing the function and utilities of LARGE are found in John Hopkins OMIM database record ID 603590, and in cited publications listed in Table 5, which are hereby incorporated by reference.Like-glycosyltransferase (LARGE, Accession NP_004728.1) is another GAM44 target gene, herein designated TARGET GENE. LARGE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LARGE, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LARGE BINDING SITE, designated SEQ ID:14179, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3984] Another function of GAM44 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NP_004728.1), a gene which is a member of the N- acetylglucosaminyl-transferase family. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE.

[3985] The function of LARGE has been established by previous studies. Peyrard et al. (1999) investigated the gene content of a segment of 22q12.3- q13.1 that had been shown to contain meningioma- related genes (OMIM Ref. No. 156100) on the basis of studies of deletions. They characterized a new member of the N- acetylglucosaminyltransferase gene family, which they designated the LARGE gene. The LARGE gene spans more than 664 kb of genomic DNA, making it the fifth largest in the human genome, after dystrophin (DMD; 300377), with 2.3 Mb; DCC (OMIM Ref. No. 120470), with 1.4 Mb; GRM8 (OMIM Ref. No. 601116), with 1 Mb; and utrophin (UTRN;

128240), with 900 kb. The LARGE gene contains 16 exons (4,326- bp cDNA) and has an exon content of less than 0.66%, which is similar to the exon content of the DMD gene (0.6%). The chromosomal segment of 22q containing the LARGE gene is apparently poor in genes. By fluorescence in situ hybridization, Peyrard et al. (1999) mapped the mouse Large gene to 8C1 in a region of conserved synteny with 22q12.3- q13.1. The expression pattern of the human and mouse LARGE orthologs is similar. Both genes are expressed ubiquitously, consistent with their function as housekeeping genes. These genes are also evolutionarily well conserved, as Peyrard et al. (1999) identified an ortholog in C. elegans encoding a polypeptide that is 33% identical with the human protein. Michele et al. (2002) demonstrated in both muscle- eye- brain disease (OMIM Ref. (2002) suggested that at least 3 mammalian genes function within a convergent posttranslational processing pathway during the biosynthesis of dystroglycan and that abnormal dystroglycan- ligand interactions underlie the pathogenic mechanism of muscular dystrophy with brain abnormalities.

[3987] It is appreciated that the abovementioned animal model for LARGE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[3988] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3989] Grewal, P. K.; Holzfeind, P. J.; Bittner, R. E.; Hewitt, J. E. : Mutant glycosyltransferase and altered glycosylation of al- pha- dystroglycan in the myodystrophy mouse. Nature Genet. 28: 151- 154, 2001. ; and

[3990] Michele, D. E.; Barresi, R.; Kanagawa, M.; Saito, F.; Cohn, R. D.; Satz, J. S.; Dollar, J.; Nishino, I.; Kelley, R. I.; Somer, H.; Straub, V.; Mathews, K. D.; Moore, S. A.; Campbell, K.

[3991] Further studies establishing the function and utilities of LARGE are found in John Hopkins OMIM database record ID 603590, and in cited publications listed in Table 5, which are hereby incorporated by reference.LAX (Accession NP_060243.1) is another GAM44 target gene, herein designated TARGET GENE. LAX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAX BINDING SITE, designated SEQ ID:9263, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3992] Another function of GAM44 is therefore inhibition of LAX (Accession NP_060243.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LAX.

[3993] Leucine zipper, down-regulated in cancer 1 (LDOC1, Accession NP_036449.1) is another GAM44 target gene, herein designated TARGET GENE. LDOC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LDOC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LDOC1 BINDING SITE, designated SEQ ID:2933, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3994] Another function of GAM44 is therefore inhibition of Leucine zipper, down-regulated in cancer 1 (LDOC1, Accession NP_036449.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDOC1.

[3995] Lipoma hmgic fusion partner (LHFP, Accession NP_005771.1) is another GAM44 target gene, herein designated TARGET GENE. LHFP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LHFP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LHFP BINDING SITE, designated SEQ ID:12839, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3996] Another function of GAM44 is therefore inhibition of Lipoma hmgic fusion partner (LHFP, Accession NP_005771.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFP.

[3997] Lin-7 homolog a (c. elegans) (LIN7A, Accession NP_004655.1) is another GAM44 target gene, herein designated TARGET GENE. LIN7A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LIN7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIN7A BINDING SITE, designated SEQ ID:3012, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[3998] Another function of GAM44 is therefore inhibition of Lin-7 homolog a (c. elegans) (LIN7A, Accession NP_004655.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with LIN7A.

[3999] LOC118987 (Accession NP_776152.1) is another GAM44 target gene, herein designated TARGET GENE. LOC118987 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC118987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118987 BINDING SITE, designated SEQ ID:9092, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4000] Another function of GAM44 is therefore inhibition of LOC118987 (Accession NP_776152.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118987.

[4001] LOC126017 (Accession XP_064903.7) is another GAM44 target gene, herein designated TARGET GENE. LOC126017 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126017, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC126017 BINDING SITE, designated SEQ ID:19476, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4002] Another function of GAM44 is therefore inhibition of LOC126017 (Accession XP_064903.7) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126017.

[4003] LOC126731 (Accession NP_660300.1) is another GAM44 target gene, herein designated TARGET GENE. LOC126731 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126731 BINDING SITE, designated SEQ ID:18542, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4004] Another function of GAM44 is therefore inhibition of LOC126731 (Accession NP_660300.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126731.

[4005] LOC130752 (Accession XP_059468.3) is another GAM44 target gene, herein designated TARGET GENE. LOC130752 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130752, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130752 BINDING SITE, designated SEQ ID:10734, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4006] Another function of GAM44 is therefore inhibition of LOC130752 (Accession XP_059468.3) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130752.

[4007] LOC144486 (Accession XP_096608.1) is another GAM44 target gene, herein designated TARGET GENE. LOC144486 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144486 BINDING SITE, designated SEQ ID:16849, to

the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4008] Another function of GAM44 is therefore inhibition of LOC144486 (Accession XP_096608.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144486.

[4009] LOC145053 (Accession XP_096714.1) is another GAM44 target gene, herein designated TARGET GENE. LOC145053 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145053, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145053 BINDING SITE, designated SEQ ID:16596, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4010] Another function of GAM44 is therefore inhibition of LOC145053 (Accession XP_096714.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145053.

[4011] LOC145216 (Accession XP_096730.1) is another GAM44

target gene, herein designated TARGET GENE. LOC145216 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145216, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:18659, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4012] Another function of GAM44 is therefore inhibition of LOC145216 (Accession XP_096730.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216.

[4013] LOC146227 (Accession XP_085374.2) is another GAM44 target gene, herein designated TARGET GENE. LOC146227 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146227, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:1810, to the nucleotide sequence of GAM44 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:287.

[4014] Another function of GAM44 is therefore inhibition of LOC146227 (Accession XP_085374.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227.

[4015] LOC146443 (Accession XP_085461.6) is another GAM44 target gene, herein designated TARGET GENE. LOC146443 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146443 BINDING SITE, designated SEQ ID:15013, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4016] Another function of GAM44 is therefore inhibition of LOC146443 (Accession XP_085461.6) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146443.

[4017] LOC146728 (Accession XP_097074.1) is another GAM44 target gene, herein designated TARGET GENE. LOC146728

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146728 BINDING SITE, designated SEQ ID:16534, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4018] Another function of GAM44 is therefore inhibition of LOC146728 (Accession XP_097074.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146728.

[4019] LOC146856 (Accession XP_096086.1) is another GAM44 target gene, herein designated TARGET GENE. LOC146856 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146856, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146856 BINDING SITE, designated SEQ ID:17740, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4020] Another function of GAM44 is therefore inhibition of LOC146856 (Accession XP_096086.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146856.

[4021] LOC147947 (Accession XP_085974.1) is another GAM44 target gene, herein designated TARGET GENE. LOC147947 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147947, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147947 BINDING SITE, designated SEQ ID:6702, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4022] Another function of GAM44 is therefore inhibition of LOC147947 (Accession XP_085974.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147947.

[4023] LOC148490 (Accession XP_086210.2) is another GAM44 target gene, herein designated TARGET GENE. LOC148490 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC148490, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148490 BINDING SITE, designated SEQ ID:18524, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4024] Another function of GAM44 is therefore inhibition of LOC148490 (Accession XP_086210.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148490.

[4025] LOC149420 (Accession NP_690048.1) is another GAM44 target gene, herein designated TARGET GENE. LOC149420 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149420, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149420 BINDING SITE, designated SEQ ID:19107, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4026] Another function of GAM44 is therefore inhibition of

LOC149420 (Accession NP_690048.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149420.

[4027] LOC151242 (Accession XP_087137.2) is another GAM44 target gene, herein designated TARGET GENE. LOC151242 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151242, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151242 BINDING SITE, designated SEQ ID:1944, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4028] Another function of GAM44 is therefore inhibition of LOC151242 (Accession XP_087137.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151242.

[4029] LOC151610 (Accession XP_087245.1) is another GAM44 target gene, herein designated TARGET GENE. LOC151610 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151610, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:12037, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4030] Another function of GAM44 is therefore inhibition of LOC151610 (Accession XP_087245.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151610.

[4031] LOC152519 (Accession XP_087483.3) is another GAM44 target gene, herein designated TARGET GENE. LOC152519 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152519, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152519 BINDING SITE, designated SEQ ID:12979, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4032] Another function of GAM44 is therefore inhibition of LOC152519 (Accession XP_087483.3) . Accordingly, utili-

ties of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152519.

[4033] LOC153077 (Accession XP_098307.1) is another GAM44 target gene, herein designated TARGET GENE. LOC153077 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:16808, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4034] Another function of GAM44 is therefore inhibition of LOC153077 (Accession XP_098307.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077.

[4035] LOC157531 (Accession XP_098772.1) is another GAM44 target gene, herein designated TARGET GENE. LOC157531 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC157531, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157531 BINDING SITE, designated SEQ ID:3461, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4036] Another function of GAM44 is therefore inhibition of LOC157531 (Accession XP_098772.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157531.

[4037] LOC158125 (Accession XP_088492.2) is another GAM44 target gene, herein designated TARGET GENE. LOC158125 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158125 BINDING SITE, designated SEQ ID:8554, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4038] Another function of GAM44 is therefore inhibition of LOC158125 (Accession XP_088492.2) . Accordingly, utili-

ties of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158125.

[4039] LOC202781 (Accession XP_117455.1) is another GAM44 target gene, herein designated TARGET GENE. LOC202781 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC202781, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC202781 BINDING SITE, designated SEQ ID:9377, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4040] Another function of GAM44 is therefore inhibition of LOC202781 (Accession XP_117455.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202781.

[4041] LOC219612 (Accession XP_168585.2) is another GAM44 target gene, herein designated TARGET GENE. LOC219612 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219612, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219612 BINDING SITE, designated SEQ ID:690, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4042] Another function of GAM44 is therefore inhibition of LOC219612 (Accession XP_168585.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219612.

[4043] LOC219731 (Accession XP_167596.1) is another GAM44 target gene, herein designated TARGET GENE. LOC219731 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:5054, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4044] Another function of GAM44 is therefore inhibition of LOC219731 (Accession XP_167596.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219731.

[4045] LOC219914 (Accession XP_167788.1) is another GAM44 target gene, herein designated TARGET GENE. LOC219914 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219914, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219914 BINDING SITE, designated SEQ ID:15995, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4046] Another function of GAM44 is therefore inhibition of LOC219914 (Accession XP_167788.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219914.

[4047] LOC219942 (Accession XP_167790.1) is another GAM44 target gene, herein designated TARGET GENE. LOC219942 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219942, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:10767, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4048] Another function of GAM44 is therefore inhibition of LOC219942 (Accession XP_167790.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219942.

[4049] LOC282976 (Accession XP_210838.1) is another GAM44 target gene, herein designated TARGET GENE. LOC282976 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282976, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282976 BINDING SITE, designated SEQ ID:2531, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4050] Another function of GAM44 is therefore inhibition of LOC282976 (Accession XP_210838.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC282976.

[4051] LOC283314 (Accession XP_210969.1) is another GAM44 target gene, herein designated TARGET GENE. LOC283314 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283314, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283314 BINDING SITE, designated SEQ ID:19120, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4052] Another function of GAM44 is therefore inhibition of LOC283314 (Accession XP_210969.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283314.

[4053] LOC283337 (Accession XP_300560.1) is another GAM44 target gene, herein designated TARGET GENE. LOC283337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283337 BINDING SITE, designated SEQ ID:7249, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4054] Another function of GAM44 is therefore inhibition of LOC283337 (Accession XP_300560.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283337.

[4055] LOC283484 (Accession XP_211053.1) is another GAM44 target gene, herein designated TARGET GENE. LOC283484 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283484, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283484 BINDING SITE, designated SEQ ID:17012, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4056] Another function of GAM44 is therefore inhibition of LOC283484 (Accession XP_211053.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283484.

[4057] LOC283767 (Accession XP_208835.1) is another GAM44 target gene, herein designated TARGET GENE. LOC283767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283767 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4058] Another function of GAM44 is therefore inhibition of LOC283767 (Accession XP_208835.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283767.

[4059] LOC283776 (Accession XP_211196.1) is another GAM44 target gene, herein designated TARGET GENE. LOC283776 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283776, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283776 BINDING SITE, designated SEQ ID:14021, to

the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4060] Another function of GAM44 is therefore inhibition of LOC283776 (Accession XP_211196.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283776.

[4061] LOC283818 (Accession XP_211218.1) is another GAM44 target gene, herein designated TARGET GENE. LOC283818 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283818, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283818 BINDING SITE, designated SEQ ID:3222, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4062] Another function of GAM44 is therefore inhibition of LOC283818 (Accession XP_211218.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283818.

[4063] LOC283906 (Accession XP_211254.1) is another GAM44

target gene, herein designated TARGET GENE. LOC283906 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283906 BINDING SITE, designated SEQ ID:19383, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4064] Another function of GAM44 is therefore inhibition of LOC283906 (Accession XP_211254.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283906.

[4065] LOC284031 (Accession XP_208982.1) is another GAM44 target gene, herein designated TARGET GENE. LOC284031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284031 BINDING SITE, designated SEQ ID:1826, to the nucleotide sequence of GAM44 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:287.

[4066] Another function of GAM44 is therefore inhibition of LOC284031 (Accession XP_208982.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284031.

[4067] LOC284462 (Accession XP_211475.1) is another GAM44 target gene, herein designated TARGET GENE. LOC284462 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284462 BINDING SITE, designated SEQ ID:17281, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4068] Another function of GAM44 is therefore inhibition of LOC284462 (Accession XP_211475.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284462.

[4069] LOC284473 (Accession XP_211474.1) is another GAM44 target gene, herein designated TARGET GENE. LOC284473

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284473, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284473 BINDING SITE, designated SEQ ID:7971, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4070] Another function of GAM44 is therefore inhibition of LOC284473 (Accession XP_211474.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284473.

[4071] LOC284578 (Accession XP_211526.1) is another GAM44 target gene, herein designated TARGET GENE. LOC284578 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284578, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284578 BINDING SITE, designated SEQ ID:13654, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4072] Another function of GAM44 is therefore inhibition of LOC284578 (Accession XP_211526.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284578.

[4073] LOC284671 (Accession XP_209313.2) is another GAM44 target gene, herein designated TARGET GENE. LOC284671 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284671 BINDING SITE, designated SEQ ID:1698, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4074] Another function of GAM44 is therefore inhibition of LOC284671 (Accession XP_209313.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284671.

[4075] LOC284684 (Accession XP_209316.1) is another GAM44 target gene, herein designated TARGET GENE. LOC284684 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284684, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284684 BINDING SITE, designated SEQ ID:2205, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4076] Another function of GAM44 is therefore inhibition of LOC284684 (Accession XP_209316.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284684.

[4077] LOC284775 (Accession XP_211635.1) is another GAM44 target gene, herein designated TARGET GENE. LOC284775 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284775, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284775 BINDING SITE, designated SEQ ID:19513, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4078] Another function of GAM44 is therefore inhibition of

LOC284775 (Accession XP_211635.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284775.

[4079] LOC284798 (Accession XP_211639.1) is another GAM44 target gene, herein designated TARGET GENE. LOC284798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284798 BINDING SITE, designated SEQ ID:18378, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4080] Another function of GAM44 is therefore inhibition of LOC284798 (Accession XP_211639.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284798.

[4081] LOC285351 (Accession XP_211856.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285351 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285351, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285351 BINDING SITE, designated SEQ ID:7404, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4082] Another function of GAM44 is therefore inhibition of LOC285351 (Accession XP_211856.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285351.

[4083] LOC285404 (Accession XP_211885.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285404 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285404, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285404 BINDING SITE, designated SEQ ID:2002, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4084] Another function of GAM44 is therefore inhibition of LOC285404 (Accession XP_211885.1) . Accordingly, utili-

ties of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285404.

[4085] LOC285422 (Accession XP_211894.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285422 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285422, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285422 BINDING SITE, designated SEQ ID:5221, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4086] Another function of GAM44 is therefore inhibition of LOC285422 (Accession XP_211894.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285422.

[4087] LOC285441 (Accession XP_211897.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285441 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285441, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285441 BINDING SITE, designated SEQ ID:18486, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4088] Another function of GAM44 is therefore inhibition of LOC285441 (Accession XP_211897.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285441.

[4089] LOC285548 (Accession XP_211936.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285548 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285548, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285548 BINDING SITE, designated SEQ ID:3710, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4090] Another function of GAM44 is therefore inhibition of LOC285548 (Accession XP_211936.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285548.

[4091] LOC285623 (Accession XP_211958.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285623 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285623, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285623 BINDING SITE, designated SEQ ID:1605, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4092] Another function of GAM44 is therefore inhibition of LOC285623 (Accession XP_211958.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285623.

[4093] LOC285747 (Accession XP_209742.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285747 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285747, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285747 BINDING SITE, designated SEQ ID:16029, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4094] Another function of GAM44 is therefore inhibition of LOC285747 (Accession XP_209742.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285747.

[4095] LOC285946 (Accession XP_212103.1) is another GAM44 target gene, herein designated TARGET GENE. LOC285946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285946 BINDING SITE, designated SEQ ID:19964, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4096] Another function of GAM44 is therefore inhibition of LOC285946 (Accession XP_212103.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285946.

[4097] LOC286345 (Accession XP_210021.1) is another GAM44 target gene, herein designated TARGET GENE. LOC286345 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286345, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286345 BINDING SITE, designated SEQ ID:1540, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4098] Another function of GAM44 is therefore inhibition of LOC286345 (Accession XP_210021.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286345.

[4099] LOC286452 (Accession XP_212323.1) is another GAM44 target gene, herein designated TARGET GENE. LOC286452 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286452, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286452 BINDING SITE, designated SEQ ID:17170, to

the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4100] Another function of GAM44 is therefore inhibition of LOC286452 (Accession XP_212323.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286452.

[4101] LOC286484 (Accession XP_208434.1) is another GAM44 target gene, herein designated TARGET GENE. LOC286484 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286484, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286484 BINDING SITE, designated SEQ ID:14618, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4102] Another function of GAM44 is therefore inhibition of LOC286484 (Accession XP_208434.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286484.

[4103] LOC338588 (Accession XP_294659.1) is another GAM44

target gene, herein designated TARGET GENE. LOC338588 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338588, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338588 BINDING SITE, designated SEQ ID:10340, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4104] Another function of GAM44 is therefore inhibition of LOC338588 (Accession XP_294659.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338588.

[4105] LOC338991 (Accession XP_290663.1) is another GAM44 target gene, herein designated TARGET GENE. LOC338991 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338991, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338991 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM44 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:287.

[4106] Another function of GAM44 is therefore inhibition of LOC338991 (Accession XP_290663.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338991.

[4107] LOC338999 (Accession XP_290659.1) is another GAM44 target gene, herein designated TARGET GENE. LOC338999 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338999, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338999 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4108] Another function of GAM44 is therefore inhibition of LOC338999 (Accession XP_290659.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338999.

[4109] LOC339161 (Accession XP_294835.1) is another GAM44 target gene, herein designated TARGET GENE. LOC339161

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339161 BINDING SITE, designated SEQ ID:7871, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4110] Another function of GAM44 is therefore inhibition of LOC339161 (Accession XP_294835.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339161.

[4111] LOC339184 (Accession XP_290743.1) is another GAM44 target gene, herein designated TARGET GENE. LOC339184 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339184 BINDING SITE, designated SEQ ID:5261, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4112] Another function of GAM44 is therefore inhibition of LOC339184 (Accession XP_290743.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339184.

[4113] LOC339437 (Accession XP_290899.1) is another GAM44 target gene, herein designated TARGET GENE. LOC339437 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339437, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339437 BINDING SITE, designated SEQ ID:19567, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4114] Another function of GAM44 is therefore inhibition of LOC339437 (Accession XP_290899.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339437.

[4115] LOC340478 (Accession XP_295258.1) is another GAM44 target gene, herein designated TARGET GENE. LOC340478 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC340478, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340478 BINDING SITE, designated SEQ ID:2003, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4116] Another function of GAM44 is therefore inhibition of LOC340478 (Accession XP_295258.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340478.

[4117] LOC341744 (Accession XP_296409.1) is another GAM44 target gene, herein designated TARGET GENE. LOC341744 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC341744, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC341744 BINDING SITE, designated SEQ ID:11667, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4118] Another function of GAM44 is therefore inhibition of

LOC341744 (Accession XP_296409.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC341744.

[4119] LOC348113 (Accession XP_300623.1) is another GAM44 target gene, herein designated TARGET GENE. LOC348113 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348113 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4120] Another function of GAM44 is therefore inhibition of LOC348113 (Accession XP_300623.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348113.

[4121] LOC348137 (Accession XP_300635.1) is another GAM44 target gene, herein designated TARGET GENE. LOC348137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348137, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348137 BINDING SITE, designated SEQ ID:10142, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4122] Another function of GAM44 is therefore inhibition of LOC348137 (Accession XP_300635.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348137.

[4123] LOC348142 (Accession XP_300636.1) is another GAM44 target gene, herein designated TARGET GENE. LOC348142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348142 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4124] Another function of GAM44 is therefore inhibition of LOC348142 (Accession XP_300636.1) . Accordingly, utili-

ties of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348142.

[4125] LOC348144 (Accession XP_300638.1) is another GAM44 target gene, herein designated TARGET GENE. LOC348144 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348144, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348144 BINDING SITE, designated SEQ ID:18221, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4126] Another function of GAM44 is therefore inhibition of LOC348144 (Accession XP_300638.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348144.

[4127] LOC348182 (Accession XP_302676.1) is another GAM44 target gene, herein designated TARGET GENE. LOC348182 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348182, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348182 BINDING SITE, designated SEQ ID:11592, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4128] Another function of GAM44 is therefore inhibition of LOC348182 (Accession XP_302676.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348182.

[4129] LOC348768 (Accession XP_302883.1) is another GAM44 target gene, herein designated TARGET GENE. LOC348768 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348768 BINDING SITE, designated SEQ ID:14195, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4130] Another function of GAM44 is therefore inhibition of LOC348768 (Accession XP_302883.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348768.

[4131] LOC350132 (Accession XP_303867.1) is another GAM44 target gene, herein designated TARGET GENE. LOC350132 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC350132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC350132 BINDING SITE, designated SEQ ID:3208, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4132] Another function of GAM44 is therefore inhibition of LOC350132 (Accession XP_303867.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC350132.

[4133] LOC350147 (Accession XP_303825.1) is another GAM44 target gene, herein designated TARGET GENE. LOC350147 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC350147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC350147 BINDING SITE, designated SEQ ID:15430, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4134] Another function of GAM44 is therefore inhibition of LOC350147 (Accession XP_303825.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC350147.

[4135] LOC351042 (Accession XP_304632.1) is another GAM44 target gene, herein designated TARGET GENE. LOC351042 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC351042 BINDING SITE, designated SEQ ID:8285, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4136] Another function of GAM44 is therefore inhibition of LOC351042 (Accession XP_304632.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC351042.

[4137] LOC57107 (Accession NP_065114.2) is another GAM44 target gene, herein designated TARGET GENE. LOC57107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:5002, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4138] Another function of GAM44 is therefore inhibition of LOC57107 (Accession NP_065114.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107.

[4139] LOC90148 (Accession XP_029430.1) is another GAM44 target gene, herein designated TARGET GENE. LOC90148 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90148, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC90148 BINDING SITE, designated SEQ ID:4641, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4140] Another function of GAM44 is therefore inhibition of LOC90148 (Accession XP_029430.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90148.

[4141] LOC92973 (Accession XP_048529.2) is another GAM44 target gene, herein designated TARGET GENE. LOC92973 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:14969, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4142] Another function of GAM44 is therefore inhibition of LOC92973 (Accession XP_048529.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973.

[4143] LOC93349 (Accession NP_612411.2) is another GAM44 target gene, herein designated TARGET GENE. LOC93349 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93349, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93349 BINDING SITE, designated SEQ ID:17460, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4144] Another function of GAM44 is therefore inhibition of LOC93349 (Accession NP_612411.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93349.

[4145] LSM10 (Accession NP_116270.1) is another GAM44 target gene, herein designated TARGET GENE. LSM10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LSM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LSM10 BINDING SITE, designated SEQ ID:918, to the nucleotide se-

quence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4146] Another function of GAM44 is therefore inhibition of LSM10 (Accession NP_116270.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LSM10.

[4147] Lymphotoxin alpha (tnf superfamily, member 1) (LTA, Accession NP_000586.2) is another GAM44 target gene, herein designated TARGET GENE. LTA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LTA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTA BINDING SITE, designated SEQ ID:3286, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4148] Another function of GAM44 is therefore inhibition of Lymphotoxin alpha (tnf superfamily, member 1) (LTA, Accession NP_000586.2), a gene which is a cytokine that in its homotrimeric form binds to tnfrsf1a/tnfr1, tnfrsf1b/tnfbr and tnfrsf14/hvem. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTA.

[4149] The function of LTA has been established by previous studies. Lymphotoxin was first characterized as a biologic factor in mitogen- stimulated lymphocytes having anticellular activity on neoplastic cell lines. It is a glycoprotein with a relative molecular mass (Mr) of 60,000- 70,000, whereas monomeric lymphotoxin has an Mr of 25,000. Gray et al. (1984) isolated a chemically synthesized gene and natural complementary DNA coding for human lymphotoxin and engineered them for expression in E. coli. Cytotoxic and necrosis effects were observed in murine and human tumor cell lines in vitro and in murine sarcomas in vivo. TNF- beta (also known as lymphotoxin- alpha, or LTA) shows 35% identity and 50% homology in amino acid sequence with the TNF- alpha (OMIM Ref. No. 191160). Aggarwal et al. (1985) showed that the 2 TNFs share a common receptor on tumor cells See 191160 for information on the situation of both TNFA and TNFB on 6p. By analysis of deletions induced in lymphoblastoid cells by gamma- irradiation, Evans et al. (1989) concluded that TNFB maps to the interval between C4 and HLA- B. Spies et al. (1989) showed that the TNF- alpha and TNF-beta gene cluster is about 210 kb from HLA- B on 6p21.3. Jongeneel et al. (1991) described polymorphic microsatel-

lites within a 12- kb region of the major histocompatibility complex that includes the TNFB locus. Lymphotoxin-alpha in a homotrimeric form is a soluble protein secreted by activated lymphocytes and presumed to act as a modulator in the immune response. The LT- alpha homotrimer shares its receptor with tumor necrosis factor and binds to both TNF receptor- 1 (OMIM Ref. No. 191190) and - 2 (191191

[4150]

[4154] Further studies establishing the function and utilities of LTA are found in John Hopkins OMIM database record ID 153440, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Methyl cpg binding protein 2 (rett syndrome) (MECP2, Accession NP_004983.1) is another GAM44 target gene, herein designated TARGET GENE. MECP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MECP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MECP2 BINDING SITE, designated SEQ ID:689, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4155] Another function of GAM44 is therefore inhibition of Methyl cpg binding protein 2 (rett syndrome) (MECP2, Accession NP_004983.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MECP2.

[4156] Meis1, myeloid ecotropic viral integration site 1 homolog (mouse) (MEIS1, Accession NP_002389.1) is another GAM44 target gene, herein designated TARGET GENE. MEIS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEIS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MEIS1 BINDING SITE, designated SEQ ID:12764, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4157] Another function of GAM44 is therefore inhibition of Meis1, myeloid ecotropic viral integration site 1 homolog (mouse) (MEIS1, Accession NP_002389.1), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS1.

[4158] The function of MEIS1 has been established by previous studies. Homeo box genes, of which the most well- characterized category is represented by the HOX genes, play a crucial role in normal development. In addition, several homeoproteins are involved in neoplasia: PPX1 (OMIM Ref. No. 176310), HOXA10 (OMIM Ref. No. 142957), and HOXB8 (OMIM Ref. No. 142963) play important roles in leukemia. The Meis1 locus was isolated by Moskow et al. (1995) as a common site of viral integration involved in myeloid leukemia in BXH- 2 mice. MEIS1 encodes a novel homeo box protein belonging to the TALE (three amino acid loop extension) family of homeodomain- containing

proteins. The homeodomain of MEIS1 is the only conserved motif within the entire 390- amino acid protein. Steelman et al. (1997) described additional members of a related gene family, which they called Meis1- related genes (MRGs; OMIM Ref. No. 601740). Mercader et al. (1999) described the role of homeo box genes Meis1, Meis2, and Pbx1 in the development of mouse, chicken, and Drosophila limbs. Mercader et al. (1999) found that Meis1 and Meis2 expression is restricted to the proximal domain, coincident with the previously reported domain in which Pbx1 is localized to the nucleus. Meis1 regulates Pbx1 activity by promoting nuclear import of the Pbx1 protein. Mercader et al. (1999) also demonstrated that ectopic expression of Meis1 in chicken disrupts distal limb development and induces distal- to- proximal transformations. Mercader et al. (1999) concluded that the restriction of Meis1 to proximal regions of the vertebrate limb is essential to specify cell fates and differentiation patterns along the proximodistal axis of the limb. Thorsteinsdottir et al. (2001) identified MEIS1 as a common collaborator with 2 divergent HOX genes, HOXA9 (OMIM Ref. No. 142956) and HOXB3 (OMIM Ref. No. 142966), in leukemic transformation. Using overexpres-

sion studies in bone marrow cells, they also demonstrated that each HOX gene studied predisposes to leukemias that are phenotypically distinct and that MEIS1 acts primarily to accelerate the occurrence of these leukemias without altering their phenotype. By fluorescence in situ hybridization, Moskow et al. (1995) mapped the human MEIS1 gene to 2p14- p13 near 3 translocation breakpoints involved in human leukemia. They mapped the murine homolog to mouse 11.

[4159]

[4160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4161] Moskow, J. J.; Bullrich, F.; Huebner, K.; Daar, I. O.; Buchberg, A. M. : Meis1, a PBX1- related homeobox gene involved in myeloid leukemia in BXH- 2 mice. Molec. Cell. Biol. 15: 5434- 5443, 1995. ; and

[4162] Steelman, S.; Moskow, J. J.; Muzynski, K.; North, C.; Druck, T.; Montgomery, J. C.; Huebner, K.; Daar, I. O.; Buchberg, A. M. : Identification of a conserved family of Meis1- related home.

[4163] Further studies establishing the function and utilities of MEIS1 are found in John Hopkins OMIM database record ID

601739, and in cited publications listed in Table 5, which are hereby incorporated by reference.Microfibrillar-associated protein 2 (MFAP2, Accession NP_002394.1) is another GAM44 target gene, herein designated TARGET GENE. MFAP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MFAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MFAP2 BINDING SITE, designated SEQ ID:2746, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4164] Another function of GAM44 is therefore inhibition of Microfibrillar-associated protein 2 (MFAP2, Accession NP_002394.1), a gene which is a component of the elastin- associated microfibrils. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFAP2.

[4165] The function of MFAP2 has been established by previous studies. The extracellular matrix contains a heterogeneous population of 3- 20 nanometer filaments that Low (1962) termed microfibrils. Microfibrils 10 nm in diameter

are present in elastic and nonelastic tissues and have a similar, if not identical, structure and composition. Gibson et al. (1986) showed that an acidic glycoprotein of 31 kD, termed the microfibril- associated glycoprotein, is a major antigen of elastin- associated microfibrils. Other elastin-associated microfibril components include fibrillin (OMIM Ref. No. 134797) and emilin (OMIM Ref. No. 130660). Chen et al. (1993) demonstrated that the mouse Magp transcript consists of 1,037 bp; that the Magp gene has 9 exons with the initiator Met codon located in exon 2; that the gene is on mouse chromosome 4 as indicated by analysis of somatic cell hybrid lines and by fluorescence in situ hybridization; and that the Magp transcript is a widespread product of mesenchymal/connective tissue cells throughout mouse development. The human homolog of MFAP2 was cloned by Faraco et al. (1995) from a human lung cDNA library using a human probe initially identified with primers from the bovine MFAP2 gene. They also studied the genomic organization of human MFAP2. Like the bovine and murine homologs, the human gene has 8 coding exons. However, it also contains two alternatively used 5- prime untranslated exons, compared with one in each of the other species. Faraco et al. (1995)

mapped the gene to 1p36.1- p35 using rodent- human somatic cell hybrids and fluorescence in situ hybridization. They used a polymorphism in intron 7 to demonstrate tight linkage to the marker D1S170 with a physical distance between the two of under 100 kb.

[4166]

[4167] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4174] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4175] Gibson, M. A.; Hughes, J. L.; Fanning, J. C.; Cleary, E. G. : The major antigen of elastin- associated microfibrils is a 31- kDa glycoprotein. J. Biol. Chem. 261: 11429- 11436, 1986. ; and

[4176] Faraco, J.; Bashir, M.; Rosenbloom, J.; Francke, U. : Characterization of the human gene for microfibril- associated glycoprotein (MFAP2), assignment to chromosome 1p36.1- p35, and linkage to.

[4177] Further studies establishing the function and utilities of MFAP2 are found in John Hopkins OMIM database record ID 156790, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC10646 (Accession NP_116082.1) is another GAM44 target gene, herein designated TARGET GENE. MGC10646 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10646, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of MGC10646 BINDING SITE, designated SEQ ID:5646, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4178] Another function of GAM44 is therefore inhibition of MGC10646 (Accession NP_116082.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10646.

[4179] MGC12435 (Accession NP_113615.1) is another GAM44 target gene, herein designated TARGET GENE. MGC12435 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC12435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12435 BINDING SITE, designated SEQ ID:7109, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4180] Another function of GAM44 is therefore inhibition of MGC12435 (Accession NP_113615.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC12435.

[4181] MGC13071 (Accession NP_116078.2) is another GAM44 target gene, herein designated TARGET GENE. MGC13071 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13071 BINDING SITE, designated SEQ ID:8673, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4182] Another function of GAM44 is therefore inhibition of MGC13071 (Accession NP_116078.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13071.

[4183] MGC17515 (Accession NP_689684.1) is another GAM44 target gene, herein designated TARGET GENE. MGC17515 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC17515, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC17515 BINDING SITE, designated SEQ ID:16554, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4184] Another function of GAM44 is therefore inhibition of MGC17515 (Accession NP_689684.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17515.

[4185] MGC2306 (Accession NP_002041.2) is another GAM44 target gene, herein designated TARGET GENE. MGC2306 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2306, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:2059, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4186] Another function of GAM44 is therefore inhibition of MGC2306 (Accession NP_002041.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306.

[4187] MGC3101 (Accession NP_076948.1) is another GAM44

target gene, herein designated TARGET GENE. MGC3101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:6021, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4188] Another function of GAM44 is therefore inhibition of MGC3101 (Accession NP_076948.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101.

[4189] MGC33215 (Accession NP_722517.1) is another GAM44 target gene, herein designated TARGET GENE. MGC33215 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33215, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33215 BINDING SITE, designated SEQ ID:9985, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4190] Another function of GAM44 is therefore inhibition of MGC33215 (Accession NP_722517.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33215.

[4191] MGC33974 (Accession NP_699181.1) is another GAM44 target gene, herein designated TARGET GENE. MGC33974 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33974, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33974 BINDING SITE, designated SEQ ID:19531, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4192] Another function of GAM44 is therefore inhibition of MGC33974 (Accession NP_699181.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33974.

[4193] MGC35440 (Accession NP_694952.1) is another GAM44 target gene, herein designated TARGET GENE. MGC35440 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC35440, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35440 BINDING SITE, designated SEQ ID:1776, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4194] Another function of GAM44 is therefore inhibition of MGC35440 (Accession NP_694952.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35440.

[4195] Molybdenum cofactor synthesis 3 (MOCS3, Accession NP_055299.1) is another GAM44 target gene, herein designated TARGET GENE. MOCS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MOCS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOCS3 BINDING SITE, designated SEQ ID:4326, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4196] Another function of GAM44 is therefore inhibition of

Molybdenum cofactor synthesis 3 (MOCS3, Accession NP_055299.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS3.

[4197] Mitochondrial ribosomal protein l21 (MRPL21, Accession NP_852616.1) is another GAM44 target gene, herein designated TARGET GENE. MRPL21 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MRPL21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL21 BINDING SITE, designated SEQ ID:1724, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4198] Another function of GAM44 is therefore inhibition of Mitochondrial ribosomal protein l21 (MRPL21, Accession NP_852616.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL21.

[4199] Mitochondrial ribosomal protein l30 (MRPL30, Accession NP_660213.1) is another GAM44 target gene, herein designated TARGET GENE. MRPL30 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MRPL30, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL30 BINDING SITE, designated SEQ ID:8553, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4200] Another function of GAM44 is therefore inhibition of Mitochondrial ribosomal protein l30 (MRPL30, Accession NP_660213.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL30.

[4201] Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_006088.2) is another GAM44 target gene, herein designated TARGET GENE. MYL9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MYL9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYL9 BINDING SITE, designated SEQ ID:1500, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA,

also designated SEQ ID:287.

[4202] Another function of GAM44 is therefore inhibition of Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_006088.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYL9.

[4203] Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_852667.1) is another GAM44 target gene, herein designated TARGET GENE. MYL9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MYL9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYL9 BINDING SITE, designated SEQ ID:1500, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4204] Another function of GAM44 is therefore inhibition of Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_852667.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYL9.

[4205] Neural cell adhesion molecule 2 (NCAM2, Accession

NP_004531.1) is another GAM44 target gene, herein designated TARGET GENE. NCAM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCAM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCAM2 BINDING SITE, designated SEQ ID:15637, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4206] Another function of GAM44 is therefore inhibition of Neural cell adhesion molecule 2 (NCAM2, Accession NP_004531.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCAM2.

[4207] Nima (never in mitosis gene a)-related kinase 6 (NEK6, Accession NP_055212.2) is another GAM44 target gene, herein designated TARGET GENE. NEK6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEK6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEK6 BINDING SITE,

designated SEQ ID:1469, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4208] Another function of GAM44 is therefore inhibition of Nima (never in mitosis gene a)-related kinase 6 (NEK6, Accession NP_055212.2), a gene which regulates nuclear and cytoplasmic aspects of the mitotic cycle. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK6.

[4209] The function of NEK6 has been established by previous studies. The Aspergillus nidulans 'never in mitosis A' (NIMA) gene encodes a serine/threonine kinase that controls initiation of mitosis. NIMA- related kinases (NEKs) are a group of protein kinases that are homologous to NIMA. Evidence suggests that NEKs perform functions similar to those of NIMA. Li et al. (1999) reported the cloning of a human liver cDNA encoding NEK6. Kimura and Okano (2001) determined that NEK6 and NEK7 (OMIM Ref. No. 606848) share 77% amino acid identity. By Northern blot analysis, Li et al. (1999) detected 1.6-, 2.6-, and 9.5- kb NEK6 transcripts. The 1.6- kb transcript was expressed at highest levels in liver and placenta. By RT- PCR,

Kimura and Okano (2001) found expression of NEK6 in all tissues examined.

[4210]

[4211] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4212] Kimura, M.; Okano, Y. : Identification and assignment of the human NIMA- related protein kinase 7 gene (NEK7) to human chromosome 1q31.3. Cytogenet. Cell Genet. 94: 33- 38, 2001. ; and

[4213] Li, M. Z.; Yu, L.; Liu, Q.; Chu, J. Y.; Zhao, S. Y. : Assignment of NEK6, a NIMA- related gene, to human chromosome 9q33.3- q34.11 by radiation hybrid mapping. Cytogenet. Cell Genet. 87:.

[4214] Further studies establishing the function and utilities of NEK6 are found in John Hopkins OMIM database record ID 604884, and in cited publications listed in Table 5, which are hereby incorporated by reference.NFASC (Accession XP_046808.8) is another GAM44 target gene, herein designated TARGET GENE. NFASC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NFASC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:8725, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4215] Another function of GAM44 is therefore inhibition of NFASC (Accession XP_046808.8) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC.

[4216] NK4 (Accession NP_004212.3) is another GAM44 target gene, herein designated TARGET GENE. NK4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NK4 BINDING SITE, designated SEQ ID:19318, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4217] Another function of GAM44 is therefore inhibition of NK4 (Accession NP_004212.3) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NK4.

[4218] NP220 (Accession NP_055312.2) is another GAM44 target

gene, herein designated TARGET GENE. NP220 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NP220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NP220 BINDING SITE, designated SEQ ID:9969, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4219] Another function of GAM44 is therefore inhibition of NP220 (Accession NP_055312.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NP220.

[4220] Neuronal pentraxin receptor (NPTXR, Accession NP_055108.2) is another GAM44 target gene, herein designated TARGET GENE. NPTXR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NPTXR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE, designated SEQ ID:3192, to the nucleotide sequence of GAM44 RNA, herein designated GAM

RNA, also designated SEQ ID:287.

[4221] Another function of GAM44 is therefore inhibition of Neuronal pentraxin receptor (NPTXR, Accession NP_055108.2). Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR.

[4222] Neuronal pentraxin receptor (NPTXR, Accession NP_478058.1) is another GAM44 target gene, herein designated TARGET GENE. NPTXR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NPTXR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE, designated SEQ ID:3192, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4223] Another function of GAM44 is therefore inhibition of Neuronal pentraxin receptor (NPTXR, Accession NP_478058.1). Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR.

[4224] Purinergic receptor p2x, ligand-gated ion channel, 5

(P2RX5, Accession NP_002552.2) is another GAM44 target gene, herein designated TARGET GENE. P2RX5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RX5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RX5 BINDING SITE, designated SEQ ID:4268, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4225] Another function of GAM44 is therefore inhibition of Purinergic receptor p2x, ligand-gated ion channel, 5 (P2RX5, Accession NP_002552.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX5.

[4226] Purinergic receptor p2x, ligand-gated ion channel, 5 (P2RX5, Accession NP_778255.1) is another GAM44 target gene, herein designated TARGET GENE. P2RX5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RX5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of P2RX5 BINDING SITE, designated SEQ ID:4268, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4227] Another function of GAM44 is therefore inhibition of Purinergic receptor p2x, ligand-gated ion channel, 5 (P2RX5, Accession NP_778255.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX5.

[4228] Phosphodiesterase 5a, cgmp-specific (PDE5A, Accession NP_246273.1) is another GAM44 target gene, herein designated TARGET GENE. PDE5A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PDE5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE5A BINDING SITE, designated SEQ ID:19020, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4229] Another function of GAM44 is therefore inhibition of Phosphodiesterase 5a, cgmp-specific (PDE5A, Accession NP_246273.1), a gene which plays a role in signal transduction by regulating the intracellular concentration of

cyclic nucleotides . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE5A.

[4230] The function of PDE5A has been established by previous studies. Cyclic nucleotide phosphodiesterases (PDEs; EC 3.1.4.17) are a superfamily of enzymes that catalyze the hydrolysis of 3- prime,5- prime- cyclic nucleotides to the corresponding nucleoside 5- prime- monophosphates. The PDEs have been subdivided into several families on the basis of sequence, substrate specificity, kinetic properties, and regulatory features. See 171885. Members of the PDE5 family are cGMP- binding, cGMP- specific enzymes. By screening several human cDNA libraries with a bovine PDE5 cDNA, Loughney et al. (1998) isolated cDNAs encoding human PDE5A. The predicted 875- amino acid human protein is approximately 96% identical to bovine PDE5A. Like the bovine protein, human PDE5A contains a cGMP- binding domain in its N- terminal portion and a catalytic domain in its C- terminal region. Recombinant PDE5A protein hydrolyzed cGMP in vitro. Northern blot analysis revealed that PDE5A is expressed as a 7.9- kb mRNA and a less abundant 6- kb mRNA in various human tissues. Loughney et al. (1998) isolated an alternatively

spliced PDE5A mRNA, PDE5A2, which encodes a protein with a differing N terminus. Independently, Stacey et al. (1998) and Yanaka et al. (1998) cloned PDE5A cDNAs. Yanaka et al. (1998) reported that the PDE5A gene contains 21 exons and spans more than 100 kb.

[4231]

[4232] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4233] Loughney, K.; Hill, T. R.; Florio, V. A.; Uher, L.; Rosman, G. J.; Wolda, S. L.; Jones, B. A.; Howard, M. L.; McAllister- Lucas, L. M.; Sonnenburg, W. K.; Francis, S. H.; Corbin, J. D.; Beavo, J. A.; Ferguson, K. : Isolation and characterization of cDNAs encoding PDE5A, a human cGMP- binding, cGMP- specific 3- prime,5- prime- cyclic nucleotide phosphodiesterase. [4234] Stacey, P.; Rulten, S.; Dapling, A.; Phillips, S. C. : Molecular cloning and expression of human cGMP- binding cGMP- specific phosphodiesterase (PDE5). Biochem. Biophys. Res. Commun. 247:.

[4235] Further studies establishing the function and utilities of PDE5A are found in John Hopkins OMIM database record ID 603310, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Pellino homolog 2 (drosophila) (PELI2, Accession NP_067078.1) is another GAM44 target gene, herein designated TARGET GENE. PELI2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PELI2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:7435, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4236] Another function of GAM44 is therefore inhibition of Pellino homolog 2 (drosophila) (PELI2, Accession NP_067078.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2.

[4237] Peptidase d (PEPD, Accession NP_000276.1) is another GAM44 target gene, herein designated TARGET GENE. PEPD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PEPD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

PEPD BINDING SITE, designated SEQ ID:4327, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4238] Another function of GAM44 is therefore inhibition of Peptidase d (PEPD, Accession NP_000276.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEPD.

[4239] PILRB (Accession NP_778212.2) is another GAM44 target gene, herein designated TARGET GENE. PILRB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PILRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PILRB BINDING SITE, designated SEQ ID:5459, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4240] Another function of GAM44 is therefore inhibition of PILRB (Accession NP_778212.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILRB.

[4241] PILRB (Accession NP_038468.3) is another GAM44 target

gene, herein designated TARGET GENE. PILRB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PILRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PILRB BINDING SITE, designated SEQ ID:5459, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4242] Another function of GAM44 is therefore inhibition of PILRB (Accession NP_038468.3) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILRB.

[4243] Pogo transposable element with znf domain (POGZ, Accession NP_055915.1) is another GAM44 target gene, herein designated TARGET GENE. POGZ BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by POGZ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POGZ BINDING SITE, designated SEQ ID:11143, to the nucleotide sequence of GAM44 RNA, herein designated GAM

RNA, also designated SEQ ID:287.

[4244] Another function of GAM44 is therefore inhibition of Pogo transposable element with znf domain (POGZ, Accession NP_055915.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POGZ.

[4245] Polymerase (rna) ii (dna directed) polypeptide d (POLR2D, Accession NP_004796.1) is another GAM44 target gene, herein designated TARGET GENE. POLR2D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POLR2D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLR2D BINDING SITE, designated SEQ ID:4052, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4246] Another function of GAM44 is therefore inhibition of Polymerase (rna) ii (dna directed) polypeptide d (POLR2D, Accession NP_004796.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR2D.

[4247] Pou domain, class 2, associating factor 1 (POU2AF1, Ac-

cession NP_006226.1) is another GAM44 target gene, herein designated TARGET GENE. POU2AF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by POU2AF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:16639, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4248] Another function of GAM44 is therefore inhibition of Pou domain, class 2, associating factor 1 (POU2AF1, Accession NP_006226.1), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2 and therefore may be associated with A form of b- cell leukemia. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of A form of b- cell leukemia, and of other diseases and clinical conditions associated with POU2AF1.

[4249] The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Protein phosphatase 1, regulatory (inhibitor)

subunit 3a (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NP_002702.1) is another GAM44 target gene, herein designated TARGET GENE. PPP1R3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R3A BINDING SITE, designated SEQ ID:20165, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4250] Another function of GAM44 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 3a (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NP_002702.1), a gene which regulates phosphatase activity towards glycogen synthase, active in skeletal muscle and therefore may be associated with Insulin resistance and glycemia variation. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Insulin resistance and glycemia variation, and of other diseases and clinical conditions associated with PPP1R3A.

[4251] The function of PPP1R3A has been established by previous studies. The glycogen- associated form of protein phosphatase- 1 (PP1) derived from skeletal muscle is a heterodimer composed of a 37- kD catalytic subunit (OMIM Ref. No. 176875) and a 124- kD targeting and regulatory subunit, referred to as PP1G by Hansen et al. (1995). PP1G binds to muscle glycogen with high affinity, thereby enhancing dephosphorylation of glycogen- bound substrates for PP1 such as glycogen synthase (e.g., 138570) and glycogen phosphorylase kinase (e.g., 306000). Phosphorylation at ser46 of the PP1G subunit in response to insulin increases PP1 activity, while phosphorylation at ser65 in response to adrenaline causes dissociation of the catalytic subunit from the G subunit and inhibits glycogen synthesis. Because of these functions, PP1G was postulated to be involved in noninsulin- dependent diabetes mellitus (NIDDM; 125853) and obesity. Savage et al. (2002) described an example of digenic inheritance of severe insulin resistance. In a family they referred to as 'a Europid pedigree' they found 5 members with severe insulin resistance and heterozygosity for frameshift/premature stop mutations in each of 2 unlinked genes, PPARG (601487.0011) and PPP1R3A (600917.0003). PPARG is

highly expressed in adipocytes, and PPP1R3A, the muscle-specific regulatory subunit of protein phosphatase 1, is centrally involved in the regulation of carbohydrate and lipid metabolism, respectively. That mutant molecules primarily involved in either carbohydrate or lipid metabolism can combine to produce a phenotype of extreme insulin resistance provides a model of interaction among genes that may underlie common human metabolic disorders such as type 2 diabetes (NIDDM). In the Europid family reported by Savage et al. (2002), the grandfather was heterozygous for the PPARG mutation, the grandmother was heterozygous for the PPP1R3A mutation. Three of their children and 2 of their grandchildren carried both mutations in heterozygous state, and all 5, but only these 5, had severe insulin resistance manifest by acanthosis nigricans, a dermatologic marker of extreme insulin resistance, and markedly elevated fasting plasma insulin levels.

[4252]

[4253] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4254] Savage, D. B.; Agostini, M.; Barroso, I.; Gurnell, M.; Luan, J.; Meirhaeghe, A.; Harding, A.- H.; Ihrke, G.; Ra-

janayagam, O.; Soos, M. A.; George, S.; Berger, D.; and 9 others : Digenic inheritance of severe insulin resistance in a human pedigree. Nature Genet. 31: 379- 384, 2002. ; and

[4255] Tang, P. M.; Bondor, J. A.; Swiderek, K. M.; DePaoli-Roach, A. A. : Molecular cloning and expression of the regulatory (RG1) subunit of the glycogen- associated protein phosphatase. J. B.

[4256] Further studies establishing the function and utilities of PPP1R3A are found in John Hopkins OMIM database record ID 600917, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pr domain containing 2, with znf domain (PRDM2, Accession NP_056950.2) is another GAM44 target gene, herein designated TARGET GENE. PRDM2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRDM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:12854, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4257] Another function of GAM44 is therefore inhibition of Pr domain containing 2, with znf domain (PRDM2, Accession NP_056950.2), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. and therefore may be associated with Tumor. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Tumor, and of other diseases and clinical conditions associated with PRDM2.

[4258] The function of PRDM2 has been established by previous studies. The retinoblastoma protein (OMIM Ref. No. 180200) is a target of viral oncoproteins. To explore the hypothesis that viral proteins may be structural mimics of cellular RB- binding proteins that normally mediate RB function, Buyse et al. (1995) searched cDNA libraries for RB- binding proteins. They reported the cloning of a cDNA for the zinc finger protein they called RIZ from rat and human cells. It is a 250- kD nuclear protein containing 8 zinc finger motifs. It contains an RB- binding motif that is related to that of the adenovirus E1A oncoprotein; RIZ also shares an antigenic epitope with the C terminus of E1A. It is expressed in human retinoblastoma cells and at low levels in all other human cell lines examined. While the function of RIZ was not clear, its structure and pattern of

expression suggested to Buyse et al. (1995) a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. The distal portion of chromosome 1p is one of the most commonly affected regions in human cancer. In a study of hereditary and sporadic colorectal cancer, Chadwick et al. (2000) identified a region of frequent deletion at 32.2 centimorgans from 1ptel. Deletion breakpoints clustered in the vicinity of or inside the gene RIZ. Sequence analysis demonstrated frequent frameshift mutations of the RIZ gene. The mutations consisted of 1- or 2- bp deletions of coding poly(A) tracts (A)8 or (A)9, and were confined to microsatellite-unstable colorectal tumors, being present in 9 of 24 (37.5%) primary tumors and in 6 of 11 (54.5%) cell lines; in 2 cell lines the mutation was homozygous (or hemizygous). The mutations apparently were selected clonally in tumorigenesis, because similar poly(A) tracts in other genes were not affected. Of the 2 alternative products of the gene, RIZ1 contains a PR domain implicated in tumor suppressor function and RIZ2 lacks this motif. Chadwick et al. (2000) proposed that RIZ is a target of observed 1p alterations, with impairment of the PR domain- mediated function through either frameshift mutation or genomic

deletion.

[4259]

[4260] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4261] Buyse, I. M.; Shao, G.; Huang, S. : The retinoblastoma protein binds to RIZ, a zinc- finger protein that shares an epitope with the adenovirus E1A protein. Proc. Nat. Acad. Sci. 92: 4467- 4471, 1995. ; and

[4262] Chadwick, R. B.; Jiang, G.- L.; Bennington, G. A.; Yuan, B.; Johnson, C. K.; Stevens, M. W.; Niemann, T. H.; Peltomaki, P.; Huang, S.; de la Chapelle, A. : Candidate tumor suppressor RIZ.

[4263] Further studies establishing the function and utilities of PRDM2 are found in John Hopkins OMIM database record ID 601196, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein kinase c, nu (PRKCN, Accession NP_005804.1) is another GAM44 target gene, herein designated TARGET GENE. PRKCN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:19159, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4264] Another function of GAM44 is therefore inhibition of Protein kinase c, nu (PRKCN, Accession NP_005804.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN.

[4265] PRO0461 (Accession NP_112558.1) is another GAM44 target gene, herein designated TARGET GENE. PRO0461 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0461 BINDING SITE, designated SEQ ID:19001, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4266] Another function of GAM44 is therefore inhibition of PRO0461 (Accession NP_112558.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0461.

[4267] Pyrroline-5-carboxylate reductase 1 (PYCR1, Accession NP_008838.2) is another GAM44 target gene, herein designated TARGET GENE. PYCR1 BINDING SITE1 and PYCR1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PYCR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PYCR1 BINDING SITE1 and PYCR1 BINDING SITE2, designated SEQ ID:17062 and SEQ ID:7092 respectively, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4268] Another function of GAM44 is therefore inhibition of Pyrroline-5-carboxylate reductase 1 (PYCR1, Accession NP_008838.2), a gene which catalyzes the NAD(P)H- dependent conversion of pyrroline- 5- carboxylate to proline. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYCR1.

[4269] The function of PYCR1 has been established by previous studies. Pyrroline- 5- carboxylate reductase (EC 1.5.1.2) catalyzes the NAD(P)H- dependent conversion of pyrroline- 5- carboxylate to proline. Merrill et al. (1989) stud-

ied the properties of human erythrocyte pyrroline- 5- carboxylate reductase. They concluded that in addition to the traditional role of catalyzing the obligatory and final unidirectional step in pyrroline biosynthesis, the enzyme may play a physiologic role in the generation of NADP(+) in some cell types including human erythrocytes. Dougherty et al. (1992) cloned a cDNA by complementation of proline auxotrophy in a Saccharomyces cerevisiae mutant strain (OMIM Ref. No. 'pro3'). The 1,810- bp cDNA hybridized to a 1.85- kb mRNA in samples from human cell lines and predicated a 319- amino acid, 33.4- kD protein. Studies of somatic cell hybrids indicated that PYCR1 is a single- copy gene that is located on chromosome 17.

[4270]

[4271] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4272] Dougherty, K. M.; Brandriss, M. C.; Valle, D. : Cloning human pyrroline- 5- carboxylate reductase cDNA by complementation in Saccharomyces cerevisiae. J. Biol. Chem. 267: 871- 875, 1992. ; and

[4273] Merrill, M. J.; Yeh, G. C.; Phang, J. M. : Purified human erythrocyte pyrroline- 5- carboxylate reductase: preferential

oxidation of NADPH. J. Biol. Chem. 264: 9352- 9358, 1989.

[4274] Further studies establishing the function and utilities of PYCR1 are found in John Hopkins OMIM database record ID 179035, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rab11-FIP2 (Accession NP_055719.1) is another GAM44 target gene, herein designated TARGET GENE. Rab11-FIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:7165, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4275] Another function of GAM44 is therefore inhibition of Rab11-FIP2 (Accession NP_055719.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2.

[4276] Rab39b, member ras oncogene family (RAB39B, Accession NP_741995.1) is another GAM44 target gene, herein des-

ignated TARGET GENE. RAB39B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB39B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB39B BINDING SITE, designated SEQ ID:14419, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4277] Another function of GAM44 is therefore inhibition of Rab39b, member ras oncogene family (RAB39B, Accession NP_741995.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39B.

[4278] Rap1b, member of ras oncogene family (RAP1B, Accession NP_056461.1) is another GAM44 target gene, herein designated TARGET GENE. RAP1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP1B BINDING SITE, designated SEQ ID:7459, to the nucleotide sequence of GAM44 RNA,

herein designated GAM RNA, also designated SEQ ID:287.

[4279] Another function of GAM44 is therefore inhibition of Rap1b, member of ras oncogene family (RAP1B, Accession NP_056461.1), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1B.

[4280] The function of RAP1B has been established by previous studies. Three human cDNAs encoding 'new' RAS- related proteins, designated RAP1A, RAP1B, and RAP2, were isolated by Pizon et al. (1988). These proteins share approximately 50% amino acid identity with the classical RAS proteins and have numerous structural features in common. The most striking difference between the RAP and RAS proteins resides in their 61st amino acid: glutamine in RAS is replaced by threonine in RAP proteins.

[4281] Animal model experiments lend further support to the function of RAP1B. Using mice transgenic for constitutive expression of Rap1a within the T cell lineage, Sebzda et al. (2002) found that instead of anergy, these T cells showed enhanced T cell receptor- mediated responses, both in thymocytes and in mature T cells. In addition,

Rap1a activation induces strong activation of beta- 1 (OMIM Ref. No. 135630) and beta- 2 (OMIM Ref. No. 600065) integrins. The authors concluded that Rap1a positively influences T cells by augmenting their responses and directing integrin activation.

[4282] It is appreciated that the abovementioned animal model for RAP1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4283] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4284] Pizon, V.; Chardin, P.; Lerosey, I.; Olofsson, B.; Tavitian, A. : Human cDNAs RAP1 and RAP2 homologous to the Drosophila gene Dras3 encode proteins closely related to ras in the 'effector' region. Oncogene 3: 201- 204, 1988. ; and

[4285] Kitayama, H.; Sugimoto, Y.; Matsuzaki, T.; Ikawa, Y.; Noda, M. : A ras- related gene with transformation suppressor activity. Cell 56: 77- 84, 1989. PubMed ID : 2642744 9. Sebzda, E.; Brac.

[4286] Further studies establishing the function and utilities of RAP1B are found in John Hopkins OMIM database record

ID 179530, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rap2a, member of ras oncogene family (RAP2A, Accession NP_066361.1) is another GAM44 target gene, herein designated TARGET GENE. RAP2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP2A BINDING SITE, designated SEQ ID:12939, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4287] Another function of GAM44 is therefore inhibition of Rap2a, member of ras oncogene family (RAP2A, Accession NP_066361.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP2A.

[4288] Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_722541.1) is another GAM44 target gene, herein designated TARGET GENE. RASGRP2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RASGRP2, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP2 BINDING SITE, designated SEQ ID:18244, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4289] Another function of GAM44 is therefore inhibition of Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_722541.1), a gene which promotes the exchange of ras- bound gdp by gtp. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP2.

[4290] The function of RASGRP2 has been established by previous studies. Rap proteins (see OMIM Ref. No. RAP1A; 179520) are members of the Ras small G protein superfamily that can inhibit Ras signaling through the Ras/RAF1 (OMIM Ref. No. 164760)/mitogen- activated protein kinase (MAPK) pathway, or, through BRAF (OMIM Ref. No. 164757), can activate MAPK. Like Ras, Rap proteins can be activated through guanine nucleotide exchange factors, or GEFs (e.g., RASGRP1; 603962). By screening a frontal cortex cDNA library, Kawasaki et al. (1998) isolated a cDNA

encoding RASGRP2, which they termed CALDAG- GEFI. The deduced 609- amino acid protein has an N- terminal GEF domain, 2 tandem repeats of EF- hand calcium-binding motifs, and a C- terminal diacylglycerol/phorbol ester- binding domain. Cells transfected with RASGRP2 showed a dramatic increase in GTP- bound RAP1A without activation of Ras proteins. Expression of RASGRP2 reduced RasV12 activation of ELK1 (OMIM Ref. No. 311040). Northern blot analysis detected an approximately 2.5- kb transcript in brain, with a striking enrichment in the striatum. Immunohistochemistry showed a basal ganglia- enriched distribution pattern in adult rat brain.

[4291]

[4292] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4293] Kawasaki, H.; Springett, G. M.; Toki, S.; Canales, J. J.; Harlan, P.; Blumenstiel, J. P.; Chen, E. J.; Bany, I. A.; Mochizuki, N.; Ashbacher, A.; Matsuda, M.; Housman, D. E.; Graybiel, A. [4294] Kedra, D.; Seroussi, E.; Fransson, I.; Trifunovic, J.; Clark,

M.; Lagercrantz, J.; Blennow, E.; Mehlin, H.; Dumanski, J. : The germinal center kinase gene and a novel CDC25- like gene are.

[4295] Further studies establishing the function and utilities of RASGRP2 are found in John Hopkins OMIM database record ID 605577, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_005816.2) is another GAM44 target gene, herein designated TARGET GENE. RASGRP2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RASGRP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP2 BINDING SITE, designated SEQ ID:18244, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4296] Another function of GAM44 is therefore inhibition of Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_005816.2), a gene which promotes the exchange of ras- bound gdp by gtp. Accordingly, utilities of GAM44 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with RASGRP2.

[4297] The function of RASGRP2 has been established by previous studies. Rap proteins (see OMIM Ref. No. RAP1A; 179520) are members of the Ras small G protein superfamily that can inhibit Ras signaling through the Ras/RAF1 (OMIM Ref. No. 164760)/mitogen- activated protein kinase (MAPK) pathway, or, through BRAF (OMIM Ref. No. 164757), can activate MAPK. Like Ras, Rap proteins can be activated through guanine nucleotide exchange factors, or GEFs (e.g., RASGRP1; 603962). By screening a frontal cortex cDNA library, Kawasaki et al. (1998) isolated a cDNA encoding RASGRP2, which they termed CALDAG- GEFI. The deduced 609- amino acid protein has an N- terminal GEF domain, 2 tandem repeats of EF- hand calcium-binding motifs, and a C- terminal diacylglycerol/phorbol ester- binding domain. Cells transfected with RASGRP2 showed a dramatic increase in GTP- bound RAP1A without activation of Ras proteins. Expression of RASGRP2 reduced RasV12 activation of ELK1 (OMIM Ref. No. 311040). Northern blot analysis detected an approximately 2.5- kb transcript in brain, with a striking enrichment in the striatum. Immunohistochemistry showed a basal ganglia- en-

riched distribution pattern in adult rat brain.

[4298]

[4299] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4300] Kawasaki, H.; Springett, G. M.; Toki, S.; Canales, J. J.; Harlan, P.; Blumenstiel, J. P.; Chen, E. J.; Bany, I. A.; Mochizuki, N.; Ashbacher, A.; Matsuda, M.; Housman, D. E.; Graybiel, A. M. : A Rap guanine nucleotide exchange factor enriched highly in the basal ganglia. Proc. Nat. Acad. Sci. 95: 13278- 13283, 1998. ; and

[4301] Kedra, D.; Seroussi, E.; Fransson, I.; Trifunovic, J.; Clark, M.; Lagercrantz, J.; Blennow, E.; Mehlin, H.; Dumanski, J. : The germinal center kinase gene and a novel CDC25- like gene are.

[4302] Further studies establishing the function and utilities of RASGRP2 are found in John Hopkins OMIM database record ID 605577, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ring finger protein 1 (RING1, Accession NP_002922.1) is another GAM44 target gene, herein designated TARGET GENE. RING1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RING1, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RING1 BINDING SITE, designated SEQ ID:11106, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4303] Another function of GAM44 is therefore inhibition of Ring finger protein 1 (RING1, Accession NP_002922.1), a gene which involves in transcriptional regulation. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RING1.

[4304] The function of RING1 has been established by previous studies. The RING finger motif is a specialized zinc finger domain found in many transcriptional regulatory proteins. This motif was defined by Lovering et al. (1993) in their characterization of the human RING1 gene. They showed that the RING finger domain of RING1 was able to bind zinc with tetrahedral coordination, as well as DNA. While screening for proteins that interact with the polycomb group protein BMI1 (OMIM Ref. No. 164831), Satijn et al. (1997) isolated the RING1 protein. They showed that RING1 binds to and colocalizes with BMI and that RING1

can act as a transcriptional repressor.

[4305]

[4306] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4307] Lovering, R.; Hanson, I. M.; Borden, K. L. B.; Martin, S.; O'Reilly, N. J.; Evan, G. I.; Rahman, D.; Pappin, D. J. C.; Trowsdale, J.; Freemont, P. S. : Identification and preliminary characterization of a protein motif related to the zinc finger. Proc. Nat. Acad. Sci. 90: 2112- 2116, 1993. ; and

[4308] Satijn, D. P. E.; Gunster, M. J.; van der Vlag, J.; Hamer, K. M.; Schul, W.; Alkema, M. J.; Saurin, A. J.; Freemont, P. S.; van Driel, R.; Otte, A. P. : RING1 is associated with the polyc.

[4309] Further studies establishing the function and utilities of RING1 are found in John Hopkins OMIM database record ID 602045, and in cited publications listed in Table 5, which are hereby incorporated by reference.RNF39 (Accession NP_079512.1) is another GAM44 target gene, herein designated TARGET GENE. RNF39 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RNF39, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF39 BINDING SITE, designated SEQ ID:5743, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4310] Another function of GAM44 is therefore inhibition of RNF39 (Accession NP_079512.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF39.

[4311] RNF39 (Accession NP_739575.1) is another GAM44 target gene, herein designated TARGET GENE. RNF39 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RNF39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF39 BINDING SITE, designated SEQ ID:5743, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4312] Another function of GAM44 is therefore inhibition of RNF39 (Accession NP_739575.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF39.

[4313] SALPR (Accession NP_057652.1) is another GAM44 target gene, herein designated TARGET GENE. SALPR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SALPR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SALPR BINDING SITE, designated SEQ ID:1044, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4314] Another function of GAM44 is therefore inhibition of SALPR (Accession NP_057652.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALPR.

[4315] Spinocerebellar ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NP_000323.1) is another GAM44 target gene, herein designated TARGET GENE. SCA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCA1 BINDING SITE, designated

SEQ ID:17933, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4316] Another function of GAM44 is therefore inhibition of Spinocerebellar ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NP_000323.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA1.

[4317] Sodium channel, nonvoltage-gated 1 alpha (SCNN1A, Accession NP_001029.1) is another GAM44 target gene, herein designated TARGET GENE. SCNN1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCNN1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCNN1A BINDING SITE, designated SEQ ID:16640, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4318] Another function of GAM44 is therefore inhibition of Sodium channel, nonvoltage-gated 1 alpha (SCNN1A, Accession NP_001029.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with SCNN1A.

[4319] Sema domain, immunoglobulin domain (ig), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 4c (SEMA4C, Accession NP_060259.2) is another GAM44 target gene, herein designated TARGET GENE. SEMA4C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SEMA4C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEMA4C BINDING SITE, designated SEQ ID:13121, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4320] Another function of GAM44 is therefore inhibition of Sema domain, immunoglobulin domain (ig), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 4c (SEMA4C, Accession NP_060259.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4C.

[4321] Splicing factor, arginine/serine-rich 2, interacting protein (SFRS2IP, Accession NP_004710.1) is another GAM44 target gene, herein designated TARGET GENE. SFRS2IP BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by SFRS2IP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:13515, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4322] Another function of GAM44 is therefore inhibition of Splicing factor, arginine/serine-rich 2, interacting protein (SFRS2IP, Accession NP_004710.1), a gene which plays an essential role in pre- mRNA splicing. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP.

[4323] The function of SFRS2IP has been established by previous studies. Like other SR proteins, the SC35 (OMIM Ref. No. 600813) splicing factor contains an arginine/serine- rich (RS) domain and an RNA- binding motif. Using a yeast 2-hybrid screen with SC35 as bait, Zhang and Wu (1998) isolated a HeLa cell partial cDNA encoding SIP1, a novel SC35- interacting protein. They used the partial cDNA to screen a HeLa cell library and recovered cDNAs corresponding to the entire SIP1 coding region. The predicted 1,403- amino acid protein contains an RS domain similar

to those found in several SR proteins and a region of weak similarity to the Drosophila splicing regulator suppressor of white- apricot (SWAP; 601945). In addition, the C- terminal region of SIP1 contains an RNA polymerase II C-terminal domain (CTD)- binding motif. Although the predicted molecular mass of SIP1 is 158 kD, the protein migrates at 210 kD by SDS- PAGE. The authors suggested that this discrepancy might result from posttranslational modifications such as phosphorylation, which is known to cause aberrant migration of several RS domain- containing proteins in SDS- PAGE. Yeast 2- hybrid assays and immunoprecipitation studies showed that SIP1 interacts with several SR proteins as well as with U2AF65 (OMIM Ref. No. 191318) and U1- 70K (OMIM Ref. No. 180740), proteins associated with the 3- prime and 5- prime splice sites, respectively. Antibodies against SIP1 depleted splicing activity from a HeLa cell nuclear extract. In the SIP1- depleted nuclear extracts, the authors found that the formation of prespliceosomal complexes A and B was deficient. Zhang and Wu (1998) concluded that SIP1 is a novel RS domain protein required for pre- mRNA splicing. By performing a yeast 2- hybrid assay to identify proteins that interact with CTD, Tanner et al. (1997) isolated partial cD-

NAs encoding SIP1, which they called CTD- associated SR protein 11 (OMIM Ref. No. CASP11) or SR- related protein of 129 kD (SRrp129). Northern blot analysis detected expression of the approximately 6- kb SRrp129 mRNA in all tissues tested.

[4324]

[4325] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4326] Zhang, W.- J.; Wu, J. Y. : Sip1, a novel RS domain- containing protein essential for pre- mRNA splicing. Molec. Cell. Biol. 18: 676- 684, 1998. ; and

[4327] Tanner, S.; Stagljar, I.; Georgiev, O.; Schaffner, W.; Bourquin, J.- P. : A novel SR- related protein specifically interacts with the carboxy- terminal domain (CTD) of RNA polymerase II throug.

[4328] Further studies establishing the function and utilities of SFRS2IP are found in John Hopkins OMIM database record ID 603668, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_006270.1) is another GAM44 target gene, herein designated TARGET

GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4329] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_006270.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4330] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777627.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4331] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777627.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4332] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777628.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4333] Another function of GAM44 is therefore inhibition of Sia-

lyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777628.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4334] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777624.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4335] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777624.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4336] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777626.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4337] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777626.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4338] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777632.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4339] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777632.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4340] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777630.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of

GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4341] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777630.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4342] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777623.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4343] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777623.1) .

Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4344] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777631.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4345] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777631.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4346] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777629.1) is

another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4347] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777629.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4348] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777625.1) is another GAM44 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4349] Another function of GAM44 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777625.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[4350] SLC30A7 (Accession NP_598003.1) is another GAM44 target gene, herein designated TARGET GENE. SLC30A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC30A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC30A7 BINDING SITE, designated SEQ ID:7436, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4351] Another function of GAM44 is therefore inhibition of SLC30A7 (Accession NP_598003.1) . Accordingly, utilities

of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC30A7.

[4352] Syntrophin, gamma 2 (SNTG2, Accession NP_061841.1) is another GAM44 target gene, herein designated TARGET GENE. SNTG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNTG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNTG2 BINDING SITE, designated SEQ ID:9285, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4353] Another function of GAM44 is therefore inhibition of Syntrophin, gamma 2 (SNTG2, Accession NP_061841.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTG2.

[4354] Sry (sex determining region y)-box 4 (SOX4, Accession NP_003098.1) is another GAM44 target gene, herein designated TARGET GENE. SOX4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX4, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9249, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4355] Another function of GAM44 is therefore inhibition of Sry (sex determining region y)-box 4 (SOX4, Accession NP_003098.1), a gene which binds with high affinity to the t- cell enhancer motif 5'- aacaaag- 3' motif. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4.

[4356] The function of SOX4 has been established by previous studies. SOX4 from both human and mouse was shown by van de Wetering et al. (1993) to be expressed primarily in T and pre- B lymphocyte cell lines. They also showed that the mouse Sox4 protein binds with high affinity to the (A/T)(A/T)CAAAG motif found in several T- cell specific enhancers. By transient expression of chimeric Sox4 constructs, van de Wetering et al. (1993) showed that Sox4 has separable DNA- binding and transactivation domains. The authors concluded that SOX4 is a lymphocyte- specific transcriptional activator. Using a yeast 2- hybrid

screen, Geijsen et al. (2001) identified the mouse transcriptional factor Sox4 as a binding partner for syntenin (SDCBP; 602217) but not for interleukin- 5 receptor- alpha (IL5RA; 147851), which interacts with the PDZ domains of syntenin. The syntenin- Sox4 interaction occurs outside of the PDZ domains of syntenin. Luciferase reporter analysis and fluorescence microscopy showed that IL5 (OMIM Ref. No. 147850), but not IL3 (OMIM Ref. No. 147740), induces cytoplasmic and nuclear expression of syntenin and, in a syntenin- and cytoplasmic IL5RA- dependent manner, of Sox4. Geijsen et al. (2001) concluded that syntenin acts as an adaptor molecule in the IL5RA-mediated activation of SOX4. They also noted that mice lacking either Il5ra or Sox4 have defects in B- cell developmen

[4357]

[4358] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4359] Geijsen, N.; Uings, I. J.; Pals, C.; Armstrong, J.; McKinnon, M.; Raaijmakers, J. A. M.; Lammers, J.- W. J.; Koenderman, L.; Coffer, P. J. : Cytokine- specific transcriptional regulation through an IL- 5R- alpha interacting protein. Science

293: 1136- 1138, 2001. ; and

[4360] Suzuki, T.; Shen, H.; Akagi, K.; Morse, H. C., III; Malley, J. D.; Naiman, D. Q.; Jenkins, N. A.; Copeland, N. G. : New genes involved in cancer identified by retroviral tagging. Nature.

[4361] Further studies establishing the function and utilities of SOX4 are found in John Hopkins OMIM database record ID 184430, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sry (sex determining region y)-box 7 (SOX7, Accession NP_113627.1) is another GAM44 target gene, herein designated TARGET GENE. SOX7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX7 BINDING SITE, designated SEQ ID:4922, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4362] Another function of GAM44 is therefore inhibition of Sry (sex determining region y)-box 7 (SOX7, Accession NP_113627.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SOX7.

[4363] SPRR4 (Accession NP_775103.1) is another GAM44 target gene, herein designated TARGET GENE. SPRR4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPRR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPRR4 BINDING SITE, designated SEQ ID:1276, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4364] Another function of GAM44 is therefore inhibition of SPRR4 (Accession NP_775103.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRR4.

[4365] Signal recognition particle receptor ('docking protein') (SRPR, Accession NP_003130.2) is another GAM44 target gene, herein designated TARGET GENE. SRPR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRPR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRPR BINDING

SITE, designated SEQ ID:14130, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4366] Another function of GAM44 is therefore inhibition of Signal recognition particle receptor ('docking protein') (SRPR, Accession NP_003130.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRPR.

[4367] Sjogren syndrome antigen a1 (52kda, ribonucleoprotein autoantigen ss-a/ro) (SSA1, Accession NP_003132.2) is another GAM44 target gene, herein designated TARGET GENE. SSA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SSA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSA1 BINDING SITE, designated SEQ ID:18743, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4368] Another function of GAM44 is therefore inhibition of Sjogren syndrome antigen a1 (52kda, ribonucleoprotein autoantigen ss-a/ro) (SSA1, Accession NP_003132.2), a gene which is a Minor component of Ro/SSA ribonucleoprotein

complexes, recognized by autoantibodies and therefore may be associated with Systemic lupus erythematosus and sjogren syndrome. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Systemic lupus erythematosus and sjogren syndrome., and of other diseases and clinical conditions associated with SSA1.

[4369] The function of SSA1 has been established by previous studies. Ro/SSA is a ribonucleoprotein that binds to autoantibodies in 35 to 50% of patients with systemic lupus erythematosus (SLE; 152700) and in up to 97% of patients with Sjogren syndrome (OMIM Ref. No. 270150). The Ro/SSA particle consists of a single 60- kD immunoreactive protein noncovalently bound with 1 of 4 small RNA molecules. Most anti- Ro/SSA- positive sera have antibodies not only against the 60- kD protein (OMIM Ref. No. 600063), but also against a 52- kD Ro/SSA protein. Itoh et al. (1991) demonstrated that the 52- kD and 60- kD autoantigens are encoded by separate genes. By radioisotopic in situ hybridization, Frank et al. (1993) mapped the RO52 gene to 11p15.5. Hybridization of portions of the cDNA probe to restriction enzyme- digested DNA indicated that the gene is composed of at least 3 exons. The exon encoding the putative zinc fingers of this protein

was found to be distinct from that which encodes the leucine zipper. Frank et al. (1993) identified a RFLP of the RO52 gene and demonstrated that it is associated with SLE, primarily in black Americans. The RO60 gene maps to chromosome 1 (Frank and Mattei, 1994). A third molecule with the properties of a Ro/SSA autoantigen is calreticulin (OMIM Ref. No. 109091), a 48,000- Da protein encoded by a gene on chromosome 19. Schoenlebe et al. (1993) reported an experience indicating that neonatal hemochromatosis, also known as perinatal hemochromatosis or neonatal iron storage disease, can occur as part of the neonatal lupus erythematosus syndrome, associated with maternal anti- Ro/SS- A and anti- La/SS- B (OMIM Ref. No. 109090) autoantibodies. They reported a 6- week- old girl with neonatal hemochromatosis whose mother had these autoantibodies associated with Sjogren syndrome; an older child had congenital heart block.

[4370]

[4371] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4372] Frank, M. B.; Itoh, K.; Fujisaku, A.; Pontarotti, P.; Mattei, M.- G.; Neas, B. R. : The mapping of the human 52- kD

Ro/SSA autoantigen gene to human chromosome 11, and its polymorphisms. Am. J. Hum. Genet. 52: 183- 191, 1993. ; and

[4373] Schoenlebe, J.; Buyon, J. P.; Zitelli, B. J.; Friedman, D.; Greco, M. A.; Knisely, A. S. : Neonatal hemochromatosis associated with maternal autoantibodies against Ro/SS- A and La/SS- B.

[4374] Further studies establishing the function and utilities of SSA1 are found in John Hopkins OMIM database record ID 109092, and in cited publications listed in Table 5, which are hereby incorporated by reference.Signal transducer and activator of transcription 1, 91kda (STAT1, Accession NP_644671.1) is another GAM44 target gene, herein designated TARGET GENE. STAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAT1 BINDING SITE, designated SEQ ID:15202, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4375] Another function of GAM44 is therefore inhibition of Sig-

nal transducer and activator of transcription 1, 91kda (STAT1, Accession NP_644671.1), a gene which is involved in transcriptional regulation. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT1.

[4376] The function of STAT1 has been established by previous studies. STAT proteins have the dual function of signal transduction and activation of transcription (Darnell et al., 1994). These proteins are activated by phosphorylation on tyrosine in response to different ligands after which they form homodimers or heterodimers that translocate to the cell nucleus where they either directly bind to DNA or act together with other DNA- binding proteins in multiprotein transcription complexes to direct transcription. The first of these proteins to be described, which they termed STAT1 (for signal transduction and activator of transcription- 1), is activated by a number of different ligands, including interferon- alpha (IFNA; 147660), interferon-gamma (IFNG; 147570), EGF (OMIM Ref. No. 131530), PDGF (see OMIM Ref. No. 173430), and IL6 (OMIM Ref. No. 147620). The same tyrosine residue is activated at least by IFN- alpha, IFN- gamma, and EGF. STAT2 (OMIM Ref. No. 600556), in contrast, is activated by IFN- alpha but

not by IFN- gamma or any of the other ligands mentioned above. STAT3 is known to be activated by IGF, IL6, LIF, and perhaps other ligands but is not activated by IFN-gamma. STAT4 (OMIM Ref. No. 600558) is present in high concentration in the testis but has not been found in a phosphorylated form in cells. The STAT proteins differ in the DNA sites to which they bind. STAT1 homodimer binds to a site termed GAS, first defined as required for IFN- gamma induction. Variations on this site are also used in response to IL6, PDGF, and other ligands.

[4377] Animal model experiments lend further support to the function of STAT1. Meraz et al. (1996) reported the generation and characterization of mice deficient in Stat1. Stat1- deficient mice showed no overt development abnormalities but displayed a complete lack of responsiveness to either interferon- alpha or interferon- gamma and were highly sensitive to infection by microbial pathogens and viruses. In contrast, these mice responded normally to several other cytokines that activate Stat1 in vitro. These observations documented that STAT1 plays an obligate and dedicated role in mediating IFN- dependent biologic responses and revealed an unexpected level of physiologic specificity for STAT1 action.

[4378] It is appreciated that the abovementioned animal model for STAT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4379] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4380] Darnell, J. E., Jr.; Kerr, I. M.; Stark, G. M. : Jak- STAT pathways and transcriptional activation in response to IFNs and other extracellular signaling proteins. Science 264: 1415- 1421, 1994. ; and

[4381] Meraz, M. A.; White, J. M.; Sheehan, K. C. F.; Bach, E. A.; Rodig, S. J.; Dighe, A. S.; Kaplan, D. H.; Riley, J. K.; Greenlund, A. C. Campbell, D.; Carver- Moore, K.; DuBois, R. N.; Clar.

[4382] Further studies establishing the function and utilities of STAT1 are found in John Hopkins OMIM database record ID 600555, and in cited publications listed in Table 5, which are hereby incorporated by reference.STHM (Accession NP_006447.1) is another GAM44 target gene, herein designated TARGET GENE. STHM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STHM, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STHM BINDING SITE, designated SEQ ID:1189, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4383] Another function of GAM44 is therefore inhibition of STHM (Accession NP_006447.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STHM.

[4384] Suppressor of ty 4 homolog 1 (s. cerevisiae) (SUPT4H1, Accession NP_003159.1) is another GAM44 target gene, herein designated TARGET GENE. SUPT4H1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SUPT4H1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUPT4H1 BINDING SITE, designated SEQ ID:16861, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4385] Another function of GAM44 is therefore inhibition of Suppressor of ty 4 homolog 1 (s. cerevisiae) (SUPT4H1, Ac-

cession NP_003159.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUPT4H1.

[4386] Supervillin (SVIL, Accession NP_003165.1) is another GAM44 target gene, herein designated TARGET GENE. SVIL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SVIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SVIL BINDING SITE, designated SEQ ID:2228, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4387] Another function of GAM44 is therefore inhibition of Supervillin (SVIL, Accession NP_003165.1), a gene which binds actin, links filamentous actin with the plasma membrane; and contains putative nuclear localization signals. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SVIL.

[4388] The function of SVIL has been established by previous studies. Pope et al. (1998) used PCR with primers based on bovine sequence to clone human supervillin. The hu-

man gene encodes a 1,788- amino acid polypeptide that contains 3 predicted nuclear localization signals, several consensus phosphorylation sites, 1 ATP/GTP- binding motif, 1 potential RNP- binding site, and 3 potential actin- binding sites. The region containing the actin-binding sites is similar to the 'headpiece' of villin (OMIM Ref. No. 193040). Dot blots showed that many tissues express supervillin, with the highest expression in muscle tissues. Northern blot analysis revealed a 7.5- kb mRNA that is abundant in some human cancer cell lines. Southern blot analysis revealed that supervillin is a single- copy gene. Activation of androgen receptor (AR; 313700) via androgen in muscle cells is closely linked to their growth and differentiation. Ting et al. (2002) cloned and characterized supervillin as an AR coregulator from a skeletal muscle cDNA library. They identified a domain within supervillin (amino acids 594 to 1,268) that could interact with the AR N terminus and DNA- binding domain- ligand- binding domain in a ligand- enhanced manner. Subcellular colocalization studies with fluorescence staining indicated that supervillin colocalized with AR in the presence of 5- alpha- dihydrotestosterone in COS- 1 cells. Furthermore, supervillin could enhance expression of the

endogenous AR target gene p27(KIP1) (OMIM Ref. No. 600778) in prostate cells. Thus, supervillin is an AR coregulator that can enhance AR transactivation in muscle and other cells.

[4389]

[4390] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4391] Pope, R. K.; Pestonjamasp, K. N.; Smith, K. P.; Wulfkuhle, J. D.; Strassel, C. P.; Lawrence, J. B.; Luna, E. J. : Cloning, characterization, and chromosomal localization of human supervillin (SVIL). Genomics 52: 342- 351, 1998. ; and

[4392] Ting, H.- J.; Yeh, S.; Nishimura, K.; Chang, C. : Supervillin associates with androgen receptor and modulates its transcriptional activity. Proc. Nat. Acad. Sci. 99: 661- 666, 2002.

[4393] Further studies establishing the function and utilities of SVIL are found in John Hopkins OMIM database record ID 604126, and in cited publications listed in Table 5, which are hereby incorporated by reference.Supervillin (SVIL, Accession NP_068506.1) is another GAM44 target gene, herein designated TARGET GENE. SVIL BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by SVIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SVIL BINDING SITE, designated SEQ ID:2228, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4394] Another function of GAM44 is therefore inhibition of Supervillin (SVIL, Accession NP_068506.1), a gene which binds actin, links filamentous actin with the plasma membrane; and contains putative nuclear localization signals. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SVIL.

[4395] The function of SVIL has been established by previous studies. Pope et al. (1998) used PCR with primers based on bovine sequence to clone human supervillin. The human gene encodes a 1,788- amino acid polypeptide that contains 3 predicted nuclear localization signals, several consensus phosphorylation sites, 1 ATP/GTP- binding motif, 1 potential RNP- binding site, and 3 potential actin- binding sites. The region containing the actin-binding sites is similar to the 'headpiece' of villin (OMIM

Ref. No. 193040). Dot blots showed that many tissues express supervillin, with the highest expression in muscle tissues. Northern blot analysis revealed a 7.5- kb mRNA that is abundant in some human cancer cell lines. Southern blot analysis revealed that supervillin is a single- copy gene. Activation of androgen receptor (AR; 313700) via androgen in muscle cells is closely linked to their growth and differentiation. Ting et al. (2002) cloned and characterized supervillin as an AR coregulator from a skeletal muscle cDNA library. They identified a domain within supervillin (amino acids 594 to 1,268) that could interact with the AR N terminus and DNA- binding domain- ligand- binding domain in a ligand- enhanced manner. Subcellular colocalization studies with fluorescence staining indicated that supervillin colocalized with AR in the presence of 5- alpha- dihydrotestosterone in COS- 1 cells. Furthermore, supervillin could enhance expression of the endogenous AR target gene p27(KIP1) (OMIM Ref. No. 600778) in prostate cells. Thus, supervillin is an AR coregulator that can enhance AR transactivation in muscle and other cells.

[4396]

[4397] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[4398] Pope, R. K.; Pestonjamasp, K. N.; Smith, K. P.; Wulfkuhle, J. D.; Strassel, C. P.; Lawrence, J. B.; Luna, E. J. : Cloning, characterization, and chromosomal localization of human supervillin (SVIL). Genomics 52: 342- 351, 1998. ; and

[4399] Ting, H.- J.; Yeh, S.; Nishimura, K.; Chang, C. : Supervillin associates with androgen receptor and modulates its transcriptional activity. Proc. Nat. Acad. Sci. 99: 661- 666, 2002.

[4400] Further studies establishing the function and utilities of SVIL are found in John Hopkins OMIM database record ID 604126, and in cited publications listed in Table 5, which are hereby incorporated by reference.TARSH (Accession NP_079077.1) is another GAM44 target gene, herein designated TARGET GENE. TARSH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TARSH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TARSH BINDING SITE, designated SEQ ID:14655, to the nucleotide sequence of GAM44 RNA, herein designated

GAM RNA, also designated SEQ ID:287.

[4401] Another function of GAM44 is therefore inhibition of TARSH (Accession NP_079077.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TARSH.

[4402] Treacher collins-franceschetti syndrome 1 (TCOF1, Accession NP_000347.1) is another GAM44 target gene, herein designated TARGET GENE. TCOF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCOF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCOF1 BINDING SITE, designated SEQ ID:12765, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4403] Another function of GAM44 is therefore inhibition of Treacher collins-franceschetti syndrome 1 (TCOF1, Accession NP_000347.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCOF1.

[4404] TD-60 (Accession NP_061185.1) is another GAM44 target gene, herein designated TARGET GENE. TD-60 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by TD-60, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TD-60 BINDING SITE, designated SEQ ID:17170, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4405] Another function of GAM44 is therefore inhibition of TD-60 (Accession NP_061185.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TD-60.

[4406] Trinucleotide repeat containing 6 (TNRC6, Accession NP_055309.1) is another GAM44 target gene, herein designated TARGET GENE. TNRC6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNRC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNRC6 BINDING SITE, designated SEQ ID:3142, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4407] Another function of GAM44 is therefore inhibition of Trin-

ucleotide repeat containing 6 (TNRC6, Accession NP_055309.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC6.

[4408] Trinucleotide repeat containing 6 (TNRC6, Accession NP_065898.1) is another GAM44 target gene, herein designated TARGET GENE. TNRC6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNRC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNRC6 BINDING SITE, designated SEQ ID:3142, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4409] Another function of GAM44 is therefore inhibition of Trinucleotide repeat containing 6 (TNRC6, Accession NP_065898.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC6.

[4410] TP53I11 (Accession NP_006025.1) is another GAM44 target gene, herein designated TARGET GENE. TP53I11 BINDING SITE is a target binding site found in the 3` untrans-

lated region of multiple transcripts of mRNA encoded by TP53I11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TP53I11 BINDING SITE, designated SEQ ID:10684, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4411] Another function of GAM44 is therefore inhibition of TP53I11 (Accession NP_006025.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53I11.

[4412] Tripartite motif-containing 37 (TRIM37, Accession NP_056109.1) is another GAM44 target gene, herein designated TARGET GENE. TRIM37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIM37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM37 BINDING SITE, designated SEQ ID:19079, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4413] Another function of GAM44 is therefore inhibition of Tri-

partite motif-containing 37 (TRIM37, Accession NP_056109.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM37.

[4414] TRIP-Br2 (Accession NP_055570.1) is another GAM44 target gene, herein designated TARGET GENE. TRIP-Br2 BINDING SITE1 and TRIP-Br2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TRIP-Br2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE1 and TRIP-Br2 BINDING SITE2, designated SEQ ID:18572 and SEQ ID:1237 respectively, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4415] Another function of GAM44 is therefore inhibition of TRIP-Br2 (Accession NP_055570.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2.

[4416] TUBA3 (Accession NP_006000.2) is another GAM44 target gene, herein designated TARGET GENE. TUBA3 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by TUBA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUBA3 BINDING SITE, designated SEQ ID:7845, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4417] Another function of GAM44 is therefore inhibition of TUBA3 (Accession NP_006000.2), a gene which is the major constituent of microtubules. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBA3.

[4418] The function of TUBA3 has been established by previous studies. Hall and Cowan (1985) screened a human genomic library with the 3- prime UTR of b- alpha- 1 and isolated the b- alpha- 1 gene and a pseudogene. The b- alpha- 1 gene is composed of 4 exons and spans less than 4 kb. It encodes a predicted 451- amino acid protein that is 100% identical to the rat homolog and differs by only 2 and 3 amino acids from the pig and chicken homologs, respectively. Furthermore, the authors observed that the first and largest intron of the b- alpha- 1 gene is homologous to that of the rat gene. Northern blotting

showed that b- alpha- 1 expression was restricted to morphologically differentiated neurologic cells Gerhard et al. (1985) studied what they thought was the testis- specific alpha- tubulin gene (OMIM Ref. No. 191110), which they designated TUBA1. By somatic cell hybrid analysis, Gerhard et al. (1985) found complete coordinate segregation of this gene with IDH1 (OMIM Ref. No. 147700), a chromosome 2 marker. Since 4 of 22 cases showed discordance with the 2p marker MDH1 (OMIM Ref. No. 154200), they concluded that this gene is probably on 2q. Todd and Naylor (1991) found that the gene studied by Gerhard et al. (1985) contains a polymorphic GT repeat sequence. Searches for homology to the primers used by Todd and Naylor (1991) revealed that Gerhard et al. (1985) and Todd and Naylor (1991) were actually studying the b- alpha- 1 gene (Rasooly, 1998).

[4419]

[4420] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4421] Hall, J. L.; Cowan, N. J. : Structural features and restricted expression of a human alpha- tubulin gene. Nucleic Acids Res. 13: 207- 223, 1985. ; and

[4422] Todd, S.; Naylor, S. L. : Dinucleotide repeat polymorphism in the human tubulin alpha 1 (testis specific) gene (TUBA1). Nucleic Acids Res. 19: 3755 only, 1991.

[4423] Further studies establishing the function and utilities of TUBA3 are found in John Hopkins OMIM database record ID 602529, and in cited publications listed in Table 5, which are hereby incorporated by reference.TWISTNB (Accession XP_166508.1) is another GAM44 target gene, herein designated TARGET GENE. TWISTNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TWISTNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TWISTNB BINDING SITE, designated SEQ ID:8569, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4424] Another function of GAM44 is therefore inhibition of TWISTNB (Accession XP_166508.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TWISTNB.

[4425] Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_068823.1) is another GAM44 target gene,

herein designated TARGET GENE. UBE2V1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2V1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE, designated SEQ ID:8971, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4426] Another function of GAM44 is therefore inhibition of Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_068823.1), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1.

[4427] The function of UBE2V1 has been established by previous studies. Rothofsky and Lin (1997) isolated human brain cDNAs encoding UBE2V1, which they called CROC1. They identified 2 alternative 5- prime CROC1 cDNA sequences, which resulted in predicted 221- and 170- amino acid proteins that differ at their N- terminal ends. The CROC1 isoforms have an acidic domain and a C- terminal basic domain. They show sequence similarity to ubiquitin- con-

jugating enzymes (UBCs, or E2s, e.g., UBE2D1; 602961) but lack the conserved cysteine residue that is critical for the catalytic activity of E2s. The CROC1 C- terminal domain has 42% sequence identity with the potential DNA-binding domain of TAFII250 (TAF2A; 313650). Immunofluorescence microscopy showed that recombinant CROC1 was located in the nucleus, excluding the nucleolar organizer regions. The authors demonstrated that CROC1 can cause transcriptional activation of the human FOS (OMIM Ref. No. 164810) promoter. Northern blot analysis detected approximately 2.1- and 2.5- kb CROC1 transcripts in all human tissues examined, with the highest levels in brain, skeletal muscle, and kidney. Sancho et al. (1998) isolated partial human intestinal epithelial cell cDNAs containing the 3- prime coding sequence and 3-prime untranslated region of UBE2V1, which they called UEV1. The UEV1 gene contains at least 6 exons and has at least 3 alternative polyadenylation sites in the 3- prime untranslated region. RT- PCR identified 4 alternatively spliced UEV1 transcripts that encode proteins with identical 90- amino acid C- terminal sequences, including the region homologous to the conserved Ubc domain of E2 enzymes, but unique N- terminal sequences. The 140-

amino acid C terminus of the deduced 221- and 170-amino acid UEV1 isoforms identified by Rothofsky and Lin (1997) is 90% identical to UEV2 (UBE2V2; 603001); it is 18%, 24%, and 22% identical to the Ubc domain of human UBE2I (OMIM Ref. No. 601661), S. cerevisiae UBC4 and UBC7, and A. thaliana UBC1, respectively. The authors showed that UEV1 does not have ubiquitin- conjugating activity in vitro. UEV1 transcripts were downregulated upon differentiation of a colon carcinoma cell line. Constitutive expression of exogenous UEV1 protein in these colon carcinoma cells inhibited their capacity to differentiate upon confluence and induced changes in their cell cycle behavior, which was associated with an inhibition of the mitotic kinase CDK1 (see OMIM Ref. No. CDC2; 116940).

[4428]

[4429] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4430] Rothofsky, M. L.; Lin, S. L. : CROC- 1 encodes a protein which mediates transcriptional activation of the human FOS promoter. Gene 195: 141- 149, 1997. ; and

[4431] Sancho, E.; Vila, M. R.; Sanchez- Pulido, L.; Lozano, J. J.;

Paciucci, R.; Nadal, M.; Fox, M.; Harvey, C.; Bercovich, B.; Loukili, N.; Ciechanover, A.; Lin, S. L.; Sanz, F.; Estivill, X.

[4432] Further studies establishing the function and utilities of UBE2V1 are found in John Hopkins OMIM database record ID 602995, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_071887.1) is another GAM44 target gene, herein designated TARGET GENE. UBE2V1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2V1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE, designated SEQ ID:8971, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4433] Another function of GAM44 is therefore inhibition of Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_071887.1), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1.

[4434] The function of UBE2V1 has been established by previous studies. Rothofsky and Lin (1997) isolated human brain cDNAs encoding UBE2V1, which they called CROC1. They identified 2 alternative 5- prime CROC1 cDNA sequences, which resulted in predicted 221- and 170- amino acid proteins that differ at their N- terminal ends. The CROC1 isoforms have an acidic domain and a C- terminal basic domain. They show sequence similarity to ubiquitin- conjugating enzymes (UBCs, or E2s, e.g., UBE2D1; 602961) but lack the conserved cysteine residue that is critical for the catalytic activity of E2s. The CROC1 C- terminal domain has 42% sequence identity with the potential DNA-binding domain of TAFII250 (TAF2A; 313650). Immunofluorescence microscopy showed that recombinant CROC1 was located in the nucleus, excluding the nucleolar organizer regions. The authors demonstrated that CROC1 can cause transcriptional activation of the human FOS (OMIM Ref. No. 164810) promoter. Northern blot analysis detected approximately 2.1- and 2.5- kb CROC1 transcripts in all human tissues examined, with the highest levels in brain, skeletal muscle, and kidney. Sancho et al. (1998) isolated partial human intestinal epithelial cell cDNAs containing the 3- prime coding sequence and 3-

prime untranslated region of UBE2V1, which they called UEV1. The UEV1 gene contains at least 6 exons and has at least 3 alternative polyadenylation sites in the 3- prime untranslated region. RT- PCR identified 4 alternatively spliced UEV1 transcripts that encode proteins with identical 90- amino acid C- terminal sequences, including the region homologous to the conserved Ubc domain of E2 enzymes, but unique N- terminal sequences. The 140-amino acid C terminus of the deduced 221- and 170-amino acid UEV1 isoforms identified by Rothofsky and Lin (1997) is 90% identical to UEV2 (UBE2V2; 603001); it is 18%, 24%, and 22% identical to the Ubc domain of human UBE2I (OMIM Ref. activity in vitro. UEV1 transcripts were downregulated upon differentiation of a colon carcinoma cell line. Constitutive expression of exogenous UEV1 protein in these colon carcinoma cells inhibited their capacity to differentiate upon confluence and induced changes in their cell cycle behavior, which was associated with an inhibition of the mitotic kinase CDK1 (see OMIM Ref. No. CDC2; 116940).

[4442]

[4443] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4444] Rothofsky, M. L.; Lin, S. L. : CROC- 1 encodes a protein which mediates transcriptional activation of the human FOS promoter. Gene 195: 141- 149, 1997. ; and

[4445] Sancho, E.; Vila, M. R.; Sanchez- Pulido, L.; Lozano, J. J.; Paciucci, R.; Nadal, M.; Fox, M.; Harvey, C.; Bercovich, B.; Loukili, N.; Ciechanover, A.; Lin, S. L.; Sanz, F.; Estivill, X.

[4446] Further studies establishing the function and utilities of UBE2V1 are found in John Hopkins OMIM database record ID 602995, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ubinuclein 1 (UBN1, Accession NP_058632.1) is another GAM44 target

gene, herein designated TARGET GENE. UBN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBN1 BINDING SITE, designated SEQ ID:17578, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4447] Another function of GAM44 is therefore inhibition of Ubinuclein 1 (UBN1, Accession NP_058632.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBN1.

[4448] WBP3 (Accession NP_783863.2) is another GAM44 target gene, herein designated TARGET GENE. WBP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WBP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBP3 BINDING SITE, designated SEQ ID:1501, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also

designated SEQ ID:287.

[4449] Another function of GAM44 is therefore inhibition of WBP3 (Accession NP_783863.2) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBP3.

[4450] Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, gamma polypeptide (YWHAG, Accession NP_036611.2) is another GAM44 target gene, herein designated TARGET GENE. YWHAG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by YWHAG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ ID:15404, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4451] Another function of GAM44 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, gamma polypeptide (YWHAG, Accession NP_036611.2), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of GAM44 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with YWHAG.

[4452] The function of YWHAG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.ZFYVE26 (Accession XP_031077.1) is another GAM44 target gene, herein designated TARGET GENE. ZFYVE26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFYVE26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFYVE26 BINDING SITE, designated SEQ ID:7546, to the nucleotide sequence of GAM44 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[4453] Another function of GAM44 is therefore inhibition of ZFYVE26 (Accession XP_031077.1) . Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFYVE26.

[4454]

[4455] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 45

(GAM45), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4456] GAM45 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM45 was detected is described hereinabove with reference to Figs. 8-15.

[4457] GAM45 gene, herein designated GAM GENE, and GAM45 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[4458] GAM45 gene encodes a GAM45 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM45 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM45 precursor RNA is designated SEQ ID:25, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:25 is located at position 35395141 relative to chromosome 9.

[4459] GAM45 precursor RNA folds onto itself, forming GAM45 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4460] GAM45 precursor RNA folds onto itself, forming GAM45 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[4461] Nucleotide sequence of GAM45 precursor RNA, designated SEQ-ID: 25, and a schematic representation of a predicted secondary folding of GAM45 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[4462] An enzyme complex designated DICER COMPLEX, `dices` the GAM45 folded precursor RNA into GAM45 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM45 RNA is designated SEQ ID:324, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[4463] GAM45 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM45 target RNA, herein designated GAM TARGET RNA. GAM45 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4464] GAM45 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM45 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM45 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such

target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM45 RNA may have a different number of target binding sites in untranslated regions of a GAM45 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4465] The complementary binding of GAM45 RNA, herein designated GAM RNA, to target binding sites on GAM45 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM45 target RNA into GAM45 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4466] It is appreciated that GAM45 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM45 target genes. The mRNA of each one of this plurality of GAM45 target genes comprises one or more target binding sites, each having a nucleotide sequence

which is at least partly complementary to GAM45 RNA, herein designated GAM RNA, and which when bound by GAM45 RNA causes inhibition of translation of respective one or more GAM45 target proteins.

[4467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM45 gene, herein designated GAM GENE, on one or more GAM45 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4468] It is appreciated that specific functions and accordingly utilities of GAM45 correlate with, and may be deduced from, the identity of the target genes which GAM45 binds

and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4469]

[4470]

[4471] FLJ25179 (Accession NM_144670.1) is a GAM45 target gene, herein designated TARGET GENE. FLJ25179 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25179, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25179 BINDING SITE, designated SEQ ID:9905, to the nucleotide sequence of GAM45 RNA, herein designated GAM RNA, also designated SEQ ID:324.

[4472] A function of GAM45 is therefore inhibition of FLJ25179 (Accession NM_144670.1) . Accordingly, utilities of GAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25179.

[4473] LOC91351 (Accession) is another GAM45 target gene, herein designated TARGET GENE. LOC91351 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91351, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:7915, to the nucleotide sequence of GAM45 RNA, herein designated GAM RNA, also designated SEQ ID:324.

[4474] Another function of GAM45 is therefore inhibition of LOC91351 (Accession) . Accordingly, utilities of GAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91351.

[4475] Unc-13-like (c. elegans) (UNC13, Accession NM_006377.1) is another GAM45 target gene, herein designated TARGET GENE. UNC13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UNC13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UNC13 BINDING SITE, designated SEQ ID:4217, to the nucleotide sequence of GAM45 RNA, herein designated GAM RNA, also designated SEQ ID:324.

[4476] Another function of GAM45 is therefore inhibition of Unc-13-like (c. elegans) (UNC13, Accession NM_006377.1), a gene which is a putative diacylglycerol receptor and may

act in PKC- independent, diacylglycerol- activated apoptosis pathway. Accordingly, utilities of GAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC13.

[4477] The function of UNC13 has been established by previous studies. The priming step of synaptic vesicle exocytosis is thought to require the formation of the SNARE complex, which comprises the proteins synaptobrevin (OMIM Ref. No. 185881), SNAP25 (OMIM Ref. No. 600322), and syntaxin (see OMIM Ref. No. 186590). In solution, syntaxin adopts a default, closed configuration that is incompatible with formation of the SNARE complex. Specifically, the amino terminus of syntaxin binds the SNARE motif and occludes interactions with the other SNARE proteins. The N terminus of syntaxin also binds the presynaptic protein UNC13. Studies in mouse, Drosophila, and Caenorhabditis elegans suggest that UNC13 functions at a post- docking step of exocytosis, most likely during synaptic vesicle priming. Therefore, UNC13 binding to the N terminus of syntaxin may promote the open configuration of syntaxin. To test this model, Richmond et al. (2001) engineered mutations into C. elegans syntaxin that caused the protein to adopt the open configuration constitutively. Richmond

et al. (2001) demonstrated that the open form of syntaxin can bypass the requirement for UNC13 in synaptic vesicle priming. Thus, Richmond et al. (2001) concluded that it is likely that UNC13 primes synaptic vesicles for fusion by promoting the open configuration of syntaxin.

[4478] Animal model experiments lend further support to the function of UNC13. Munc13- 1 is a presynaptic protein with an essential role in synaptic vesicle priming. It contains a diacylglycerol (DAG)/beta phorbol ester- binding C1 domain and is a potential target of the DAG second messenger pathway that may act in parallel with protein kinases C (PKCs; OMIM Ref. No. 600448). Using genetically modified mice that expressed a DAG/beta phorbol ester- binding- deficient Munc13- 1 variant (missense mutation his567 to lys) instead of the wildtype protein, Rhee et al. (2002) determined the relative contribution of PKCs and Munc13- 1 to DAG/beta phorbol ester- dependent regulation of neurotransmitter release. They showed that Munc13s are the main presynaptic DAG/beta phorbol ester receptors in hippocampal neurons. Modulation of Munc13- 1 activity by second messengers via the DAG/beta phorbol ester- binding C1 domain is essential for use- dependent alterations of synaptic efficacy and sur-

vival.

[4479] It is appreciated that the abovementioned animal model for UNC13 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4480] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4481] Richmond, J. E.; Weimer, R. M.; Jorgensen, E. M. : An open form of syntaxin bypasses the requirement for UNC- 13 in vesicle priming. Nature 412: 338- 341, 2001. ; and

[4482] Rhee, J.- S.; Betz, A.; Pyott, S.; Reim, K.; Varoqueaux, F.; Augustin, I.; Hesse, D.; Sudhof, T. C.; Takahashi, M.; Rosenmund, C.; Brose, N. : Beta phorbol ester- and diacylglycerol- indu.

[4483] Further studies establishing the function and utilities of UNC13 are found in John Hopkins OMIM database record ID 605836, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[4484] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 46 (GAM46), which modulates expression of respective target

genes thereof, the function and utility of which target genes is known in the art.

[4485] GAM46 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM46 was detected is described hereinabove with reference to Figs. 8-15.

[4486] GAM46 gene, herein designated GAM GENE, and GAM46 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[4487] GAM46 gene encodes a GAM46 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM46 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM46 precursor RNA is designated SEQ ID:41, and is provided hereinbelow with reference to the sequence listing part.

[4488] GAM46 precursor RNA folds onto itself, forming GAM46 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
